## CONTENTS

3.3 Vector Scaling Using the C Extension .......................... 18
   3.3.1 Adding an OpenCL Task Implementation .................. 19
   3.3.2 Adding a CUDA Task Implementation ....................... 20
3.4 Vector Scaling Using StarPU's API .............................. 21
   3.4.1 Source Code of Vector Scaling ............................. 21
   3.4.2 Execution of Vector Scaling ............................... 22
3.5 Vector Scaling on an Hybrid CPU/GPU Machine .................. 22
   3.5.1 Definition of the CUDA Kernel .......................... 22
   3.5.2 Definition of the OpenCL Kernel ......................... 22
   3.5.3 Definition of the Main Code ............................. 23
   3.5.4 Execution of Hybrid Vector Scaling ...................... 25

II StarPU Quick Programming Guide ................................. 27

4 Advanced Examples .............................................. 29

5 Check List When Performance Are Not There ..................... 31
   5.1 Check Task Size ........................................... 31
   5.2 Configuration Which May Improve Performance .............. 31
   5.3 Data Related Features Which May Improve Performance .... 31
   5.4 Task Related Features Which May Improve Performance .... 31
   5.5 Scheduling Related Features Which May Improve Performance... 31
   5.6 CUDA-specific Optimizations ................................ 32
   5.7 OpenCL-specific Optimizations ................................ 32
   5.8 Detecting Stuck Conditions .................................. 33
   5.9 How to Limit Memory Used By StarPU And Cache Buffer Allocations... 33
   5.10 How To Reduce The Memory Footprint Of Internal Data Structures .... 33
   5.11 How To Reuse Memory ..................................... 34
   5.12 Performance Model Calibration ................................ 34
   5.13 Profiling ............................................... 36
   5.14 Overhead Profiling ....................................... 36

III StarPU Inside .................................................. 37

6 Tasks In StarPU ................................................ 39
   6.1 Task Granularity ........................................... 39
   6.2 Task Submission ............................................. 39
   6.3 Task Priorities ............................................. 39
   6.4 Task Dependencies ......................................... 39
      6.4.1 Sequential Consistency ................................ 39
      6.4.2 Tasks And Tags Dependencies ....................... 40
   6.5 Setting Many Data Handles For a Task ....................... 40
   6.6 Setting a Variable Number Of Data Handles For a Task .......... 41
   6.7 Using Multiple Implementations Of A Codelet ................ 41
   6.8 Enabling Implementation According To Capabilities ........... 41
   6.9 Insert Task Utility ....................................... 42
   6.10 Getting Task Children .................................... 44
   6.11 Parallel Tasks .......................................... 44
      6.11.1 Fork-mode Parallel Tasks ............................ 44
      6.11.2 SPMD-mode Parallel Tasks ............................ 45
      6.11.3 Parallel Tasks Performance ......................... 45
      6.11.4 Combined Workers ................................... 45
      6.11.5 Concurrent Parallel Tasks ............................ 45
      6.11.6 Synchronization Tasks ............................... 46

7 Data Management ............................................... 47
   7.1 Data Interface ............................................. 47
8 Scheduling 59
  8.1 Task Scheduling Policies .............................................. 59
  8.2 Performance Model-Based Task Scheduling Policies .............. 59
  8.3 Task Distribution Vs Data Transfer ................................. 60
  8.4 Energy-based Scheduling ............................................... 60
  8.5 Static Scheduling ...................................................... 61
  8.6 Defining A New Scheduling Policy .................................. 61
  8.7 Graph-based Scheduling ............................................... 62
  8.8 Debugging Scheduling .................................................. 62

9 Scheduling Contexts 63
  9.1 General Ideas ............................................................ 63
  9.2 Creating A Context ...................................................... 63
    9.2.1 Creating A Context With The Default Behavior .............. 64
  9.3 Creating A Context ...................................................... 64
  9.4 Modifying A Context .................................................... 64
  9.5 Submitting Tasks To A Context ...................................... 64
  9.6 Deleting A Context ...................................................... 65
  9.7 Emptying A Context ..................................................... 65

10 Scheduling Context Hypervisor 67
  10.1 What Is The Hypervisor ............................................... 67
  10.2 Start the Hypervisor ................................................... 67
  10.3 Interrogate The Runtime .............................................. 67
  10.4 Trigger the Hypervisor ............................................... 67
  10.5 Resizing Strategies ................................................... 68
  10.6 Defining A New Hypervisor Policy ................................. 69

11 Modularized Scheduler 71
  11.1 Introduction ............................................................. 71
  11.2 Using Modularized Schedulers ...................................... 71
    11.2.1 Existing Modularized Schedulers ............................... 71
    11.2.2 An Example : The Tree-Eager-Prefetching Strategy ......... 72
    11.2.3 Interface .......................................................... 72
  11.3 Building a Modularized Scheduler .................................. 72
    11.3.1 Pre-implemented Components .................................. 73
    11.3.2 Progression And Validation Rules .............................. 73
16.7 Performances .......................................................... 113
16.8 Disk functions ......................................................... 113
17 MPI Support ............................................................ 115
17.1 Example used in this documentation ............................... 115
17.2 About not using the MPI support .................................. 115
17.3 Simple Example ....................................................... 116
17.4 How to Initialize StarPU-MPI ...................................... 117
17.5 Point To Point Communication ..................................... 117
17.6 Exchanging User Defined Data Interface .......................... 118
17.7 MPI Insert Task Utility .............................................. 119
17.8 Pruning MPI task insertion ......................................... 121
17.9 Temporary Data ...................................................... 121
17.10 Per-node Data ....................................................... 122
17.11 Priorities ............................................................. 122
17.12 MPI cache support .................................................. 123
17.13 MPI Data migration ................................................ 123
17.14 MPI Collective Operations ......................................... 124
17.15 Make StarPU-MPI progression thread execute tasks ............ 124
17.16 Debugging MPI ...................................................... 125
17.17 More MPI examples ................................................ 125
17.18 Notes about the Implementation ................................... 125
17.19 MPI Master Slave Support ........................................ 126
18 FFT Support ........................................................... 127
18.1 Compilation .......................................................... 127
19 MIC/SCC Support ....................................................... 129
19.1 Compilation .......................................................... 129
19.2 Porting Applications To MIC Xeon Phi / SCC ..................... 129
19.3 Launching Programs ................................................. 130
20 C Extensions .......................................................... 131
20.1 Defining Tasks ........................................................ 131
20.2 Initialization, Termination, and Synchronization ................. 133
20.3 Registered Data Buffers ............................................. 133
20.4 Using C Extensions Conditionally ................................. 134
21 Native Fortran Support ................................................ 137
21.1 Implementation Details and Specificities ......................... 137
21.1.1 Prerequisites ...................................................... 137
21.1.2 Configuration ..................................................... 137
21.1.3 Examples ......................................................... 137
21.1.4 Compiling a Native Fortran Application ....................... 137
21.2 Fortran Translation for Common StarPU API Idioms .............. 138
21.3 Uses, Initialization and Shutdown ................................... 139
21.4 Fortran Flavor of StarPU's Variadic Insert_task .................. 139
21.5 Functions and Subroutines Expecting Data Structures Arguments 139
21.6 Additional Notes about the Native Fortran Support ............... 140
21.6.1 Using StarPU with Older Fortran Compilers ................ 140
21.6.2 Valid API Mixes and Language Mixes ....................... 140
22 SOCL OpenCL Extensions ............................................. 141
23 SimGrid Support ....................................................... 143
23.1 Preparing Your Application For Simulation ....................... 143
23.2 Calibration .......................................................... 143
23.3 Simulation .......................................................... 144
23.4 Simulation On Another Machine .................................... 144

Chapter 1

Introduction

1.1 Motivation

The use of specialized hardware such as accelerators or coprocessors offers an interesting approach to overcome
the physical limits encountered by processor architects. As a result, many machines are now equipped with one or
several accelerators (e.g. a GPU), in addition to the usual processor(s). While a lot of efforts have been devoted
to offload computation onto such accelerators, very little attention as been paid to portability concerns on the one
hand, and to the possibility of having heterogeneous accelerators and processors to interact on the other hand.

StarPU is a runtime system that offers support for heterogeneous multicore architectures, it not only offers a unified
view of the computational resources (i.e. CPUs and accelerators at the same time), but it also takes care of efficiently
mapping and executing tasks onto an heterogeneous machine while transparently handling low-level issues such as
data transfers in a portable fashion.

1.2 StarPU in a Nutshell

StarPU is a software tool aiming to allow programmers to exploit the computing power of the available CPUs and
GPUs, while relieving them from the need to specially adapt their programs to the target machine and processing
units.

At the core of StarPU is its runtime support library, which is responsible for scheduling application-provided tasks
on heterogeneous CPU/GPU machines. In addition, StarPU comes with programming language support, in the
form of extensions to languages of the C family (C Extensions), as well as an OpenCL front-end (SOCL OpenCL
Extensions).

StarPU's runtime and programming language extensions support a task-based programming model. Applications
submit computational tasks, with CPU and/or GPU implementations, and StarPU schedules these tasks and associ-
ciated data transfers on available CPUs and GPUs. The data that a task manipulates are automatically transferred
among accelerators and the main memory, so that programmers are freed from the scheduling issues and technical
details associated with these transfers.

StarPU takes particular care of scheduling tasks efficiently, using well-known algorithms from the literature (Task
Scheduling Policies). In addition, it allows scheduling experts, such as compiler or computational library developers,
to implement custom scheduling policies in a portable fashion (Defining A New Scheduling Policy).

The remainder of this section describes the main concepts used in StarPU.

1.2.1 Codelet and Tasks

One of the StarPU primary data structures is the codelet. A codelet describes a computational kernel that can
possibly be implemented on multiple architectures such as a CPU, a CUDA device or an OpenCL device.

Another important data structure is the task. Executing a StarPU task consists in applying a codelet on a data set,
on one of the architectures on which the codelet is implemented. A task thus describes the codelet that it uses, but
also which data are accessed, and how they are accessed during the computation (read and/or write). StarPU tasks
are asynchronous: submitting a task to StarPU is a non-blocking operation. The task structure can also specify a
callback function that is called once StarPU has properly executed the task. It also contains optional fields that the
application may use to give hints to the scheduler (such as priority levels).

By default, task dependencies are inferred from data dependency (sequential coherency) by StarPU. The application
can however disable sequential coherency for some data, and dependencies can be specifically expressed. A task may be identified by a unique 64-bit number chosen by the application which we refer as a **tag**. Task dependencies can be enforced either by the means of callback functions, by submitting other tasks, or by expressing dependencies between tags (which can thus correspond to tasks that have not yet been submitted).

### 1.2.2 StarPU Data Management Library

Because StarPU schedules tasks at runtime, data transfers have to be done automatically and "just-in-time" between processing units, relieving application programmers from explicit data transfers. Moreover, to avoid unnecessary transfers, StarPU keeps data where it was last needed, even if it was modified there, and it allows multiple copies of the same data to reside at the same time on several processing units as long as it is not modified.

### 1.3 Application Taskification

**TODO**

### 1.4 Glossary

- **A codelet** records pointers to various implementations of the same theoretical function.
- **A memory node** can be either the main RAM, GPU-embedded memory or a disk memory.
- **A bus** is a link between memory nodes.
- **A data handle** keeps track of replicates of the same data (registered by the application) over various memory nodes. The data management library manages to keep them coherent. The **home** memory node of a data handle is the memory node from which the data was registered (usually the main memory node).
- **A task** represents a scheduled execution of a codelet on some data handles.
- **A tag** is a rendez-vous point. Tasks typically have their own tag, and can depend on other tags. The value is chosen by the application.
- **A worker** execute tasks. There is typically one per CPU computation core and one per accelerator (for which a whole CPU core is dedicated).
- **A driver** drives a given kind of workers. There are currently CPU, CUDA, and OpenCL drivers. They usually start several workers to actually drive them.
- **A performance model** is a (dynamic or static) model of the performance of a given codelet. Codelets can have execution time performance model as well as energy consumption performance models.
- **A data interface** describes the layout of the data: for a vector, a pointer for the start, the number of elements and the size of elements; for a matrix, a pointer for the start, the number of elements per row, the offset between rows, and the size of each element; etc. To access their data, codelet functions are given interfaces for the local memory node replicates of the data handles of the scheduled task.
- **Partitioning** data means dividing the data of a given data handle (called **father** into a series of **children** data handles which designate various portions of the former.
- **A filter** is the function which computes children data handles from a father data handle, and thus describes how the partitioning should be done (horizontal, vertical, etc.)
- **Acquiring** a data handle can be done from the main application, to safely access the data of a data handle from its home node, without having to unregister it.

### 1.5 Research Papers

Research papers about StarPU can be found at [http://starpu.gforge.inria.fr/publications/](http://starpu.gforge.inria.fr/publications/). A good overview is available in the research report at [http://hal.archives-ouvertes.fr/inria-00467677](http://hal.archives-ouvertes.fr/inria-00467677).

### 1.6 StarPU Applications

You can first have a look at the chapters **Basic Examples** and **Advanced Examples**. A tutorial is also installed in the directory `share/doc/starpu/tutorial/`. Many examples are also available in the StarPU sources in the directory `examples/`. Simple examples include:
1.7 Further Reading

**incrementer/** Trivial incrementation test.

**basic_examples/** Simple documented Hello world and vector/scalar product (as shown in Basic Examples), matrix product examples (as shown in Performance Model Example), an example using the blocked matrix data interface, an example using the variable data interface, and an example using different formats on CPUs and GPUs.

**matvecmult/** OpenCL example from NVidia, adapted to StarPU.

**axpy/** AXPY CUBLAS operation adapted to StarPU.

**native_fortran/** Example of using StarPU’s native Fortran support.

**fortran90/** Example of Fortran 90 bindings, using C marshalling wrappers.

**fortran/** Example of Fortran 77 bindings, using C marshalling wrappers.

More advanced examples include:

**filters/** Examples using filters, as shown in Partitioning Data.

**lu/** LU matrix factorization, see for instance xluImplicit.c

**cholesky/** Cholesky matrix factorization, see for instance choleskyImplicit.c.

### 1.7 Further Reading

The documentation chapters include:

- Part 1: StarPU Basics
  - Building and Installing StarPU
  - Basic Examples

- Part 2: StarPU Quick Programming Guide
  - Advanced Examples
  - Check List When Performance Are Not There

- Part 3: StarPU Inside
  - Tasks In StarPU
  - Data Management
  - Scheduling
  - Scheduling Contexts
  - Scheduling Context Hypervisor
  - Modularized Schedulers
  - Debugging Tools
  - Online Performance Tools
  - Offline Performance Tools
  - Frequently Asked Questions

- Part 4: StarPU Extensions
  - Out Of Core
  - MPI Support
  - FFT Support
  - MIC Xeon Phi / SCC Support
  - C Extensions
- The StarPU Native Fortran Support
- SOCL OpenCL Extensions
- SimGrid Support
- The StarPU OpenMP Runtime Support (SORS)
- Clustering A Machine

• Part 5: StarPU Reference API
  - Execution Configuration Through Environment Variables
  - Compilation Configuration
  - ModuleDocumentation
  - FileDocumentation
  - Deprecated List

• Part: Appendix
  - Full source code for the ‘Scaling a Vector’ example
  - The GNU Free Documentation License

Make sure to have had a look at those too!
Part I

StarPU Basics
Chapter 2

Building and Installing StarPU

2.1 Installing a Binary Package

One of the StarPU developers being a Debian Developer, the packages are well integrated and very up-to-date. To see which packages are available, simply type:

```
$ apt-cache search starpu
```

To install what you need, type for example:

```
$ sudo apt-get install libstarpu-1.3 libstarpu-dev
```

2.2 Installing from Source

StarPU can be built and installed by the standard means of the GNU autotools. The following chapter is intended to briefly remind how these tools can be used to install StarPU.

2.2.1 Optional Dependencies

The **hwloc** ([http://www.open-mpi.org/software/hwloc](http://www.open-mpi.org/software/hwloc)) topology discovery library is not mandatory to use StarPU but strongly recommended. It allows for topology aware scheduling, which improves performance. **libhwloc** is available in major free operating system distributions, and for most operating systems.

If **libhwloc** is installed in a standard location, no option is required, it will be detected automatically, otherwise **--with-hwloc=directory** should be used to specify its location.

If **libhwloc** is not available on your system, the option **--without-hwloc** should be explicitly given when calling the **configure** script.

2.2.2 Getting Sources

StarPU's sources can be obtained from the download page of the StarPU website ([http://starpu.gforge.inria.fr/files/](http://starpu.gforge.inria.fr/files/)). All releases and the development tree of StarPU are freely available on Inria's gforge under the LGPL license. Some releases are available under the BSD license.

The latest release can be downloaded from the Inria's gforge ([http://gforge.inria.fr/frs/?group_id=1570](http://gforge.inria.fr/frs/?group_id=1570)) or directly from the StarPU download page ([http://starpu.gforge.inria.fr/files/](http://starpu.gforge.inria.fr/files/)).

The latest nightly snapshot can be downloaded from the StarPU gforge website ([http://starpu.gforge.inria.fr/testing/](http://starpu.gforge.inria.fr/testing/)).

```
$ wget http://starpu.gforge.inria.fr/testing/starpu-nightly-latest.tar.gz
```

And finally, current development version is also accessible via git. It should only be used if you need the very latest changes (i.e. less than a day old!).

```
$ git clone https://scm.gforge.inria.fr/anonscm/git/starpu/starpu.git
```
2.2.3 Configuring StarPU

Running `autogen.sh` is not necessary when using the tarball releases of StarPU. However when using the source code from the git repository, you first need to generate the configure scripts and the Makefiles. This requires the availability of `autoconf` and `automake` ≥ 2.60.

```
$ ./autogen.sh
```

You then need to configure StarPU. Details about options that are useful to give to `./configure` are given in **Compilation Configuration**.

```
$ ./configure
```

If `configure` does not detect some software or produces errors, please make sure to post the contents of the file `config.log` when reporting the issue.

By default, the files produced during the compilation are placed in the source directory. As the compilation generates a lot of files, it is advised to put them all in a separate directory. It is then easier to cleanup, and this allows to compile several configurations out of the same source tree. To do so, simply enter the directory where you want the compilation to produce its files, and invoke the `configure` script located in the StarPU source directory.

```
$ mkdir build
$ cd build
$ ../configure
```

By default, StarPU will be installed in `/usr/local/bin`, `/usr/local/lib`, etc. You can specify an installation prefix other than `/usr/local` using the option `-prefix`, for instance:

```
$ ../configure --prefix=$HOME/starpu
```

2.2.4 Building StarPU

```
$ make
```

Once everything is built, you may want to test the result. An extensive set of regression tests is provided with StarPU. Running the tests is done by calling `make check`. These tests are run every night and the result from the main profile is publicly available ([http://starpu.gforge.inria.fr/testing/](http://starpu.gforge.inria.fr/testing/)).

```
$ make check
```

2.2.5 Installing StarPU

In order to install StarPU at the location which was specified during configuration:

```
$ make install
```

Libtool interface versioning information are included in libraries names (`libstarpu-1.3.so`, `libstarpumpi-1.3.so` and `libstarpufft-1.3.so`).

2.3 Setting up Your Own Code

2.3.1 Setting Flags for Compiling, Linking and Running Applications

StarPU provides a `pkg-config` executable to obtain relevant compiler and linker flags. As compiling and linking an application against StarPU may require to use specific flags or libraries (for instance CUDA or `libspe2`). If StarPU was not installed at some standard location, the path of StarPU's library must be specified in the environment variable `PKG_CONFIG_PATH` to allow `pkg-config` to find it. For example if StarPU was installed in `$STARPU_PATH`:

```
$ PKG_CONFIG_PATH=$PKG_CONFIG_PATH:$STARPU_PATH/lib/pkgconfig
```

The flags required to compile or link against StarPU are then accessible with the following commands:

```
$ pkg-config --cflags starpu-1.3   # options for the compiler
$ pkg-config --libs starpu-1.3    # options for the linker
```
Note that it is still possible to use the API provided in the version 1.0 of StarPU by calling `pkg-config` with the `starpu-1.0` package. Similar packages are provided for `starpumpi-1.0` and `starpufft-1.0`. It is also possible to use the API provided in the version 0.9 of StarPU by calling `pkg-config` with the `libstarpu` package. Similar packages are provided for `libstarpumpi` and `libstarpufft`.

Make sure that `pkg-config -libs starpu-1.3` actually produces some output before going further. `PKG_CONFIG_PATH` has to point to the place where `starpu-1.3.pc` was installed during `make install`. Also pass the option `-static` if the application is to be linked statically.

It is also necessary to set the environment variable `LD_LIBRARY_PATH` to locate dynamic libraries at runtime.

```bash
$ LD_LIBRARY_PATH=$STARPU_PATH/lib:$LD_LIBRARY_PATH
```

When using a Makefile, the following lines can be added to set the options for the compiler and the linker:

```bash
CFLAGS += $$(`pkg-config --cflags starpu-1.3`)  
LDFLAGS += $$(`pkg-config --libs starpu-1.3`)  
```

### 2.3.2 Integrating StarPU in a Build System

#### 2.3.2.1 Integrating StarPU in a CMake Build System

This section shows a minimal example integrating StarPU in an existing application’s CMake build system. Let’s assume we want to build an executable from the following source code using CMake:

```c
#include <starpu.h>  
int main(void)  
{  
  int ret;  
  ret = starpu_init(NULL);  
  if (ret != 0)  
  {  
    return 1;  
  }  
  starpu_shutdown();  
  return 0;  
}
```

The `CMakeLists.txt` file below uses the Pkg-Config support from CMake to autodetect the StarPU installation and library dependences (such as `libhwloc`) provided that the `PKG_CONFIG_PATH` variable is set, and is sufficient to build a statically-linked executable. This example has been successfully tested with CMake 3.2, though it may work with earlier CMake 3.x versions.

```bash
{CMakeLists.txt}
cmake_minimum_required (VERSION 3.2)  
project (hello_starpu)  
find_package(PkgConfig)  
pkg_check_modules(STARPU REQUIRED starpu-1.3)  
if (STARPU_FOUND)  
  include_directories (${STARPU_INCLUDE_DIRS})  
  link_directories (${STARPU_STATIC_LIBRARY_DIRS})  
  link_libraries (${STARPU_STATIC_LIBRARIES})  
else (STARPU_FOUND)  
  message(FATAL_ERROR "StarPU not found")  
endif()  
add_executable(hello_starpu hello_starpu.c)
```

The following `CMakeLists.txt` implements an alternative, more complex strategy, still relying on PkgConfig, but also taking into account additional flags. While more complete, this approach makes CMake’s build types (Debug, Release, …) unavailable because of the direct affectation to variable `CMAKE_C_FLAGS`. If both the full flags support and the build types support are needed, the `CMakeLists.txt` below may be altered to work with `CMAKE_CFLAGS_RELEASE`, `CMAKE_CFLAGS_DEBUG`, and others as needed. This example has been successfully tested with CMake 3.2, though it may work with earlier CMake 3.x versions.

```bash
{CMakeLists.txt}
cmake_minimum_required (VERSION 3.2)  
project (hello_starpu)  
find_package(PkgConfig)  
pkg_check_modules(STARPU REQUIRED starpu-1.3)  
# This section must appear before 'add_executable'
```
2.3.3 Running a Basic StarPU Application

Basic examples using StarPU are built in the directory `examples/basic_examples/` (and installed in `$STARPU_PATH/lib/starpu/examples/`). You can for example run the example `vector_scal`:

```
$ ./examples/basic_examples/vector_scal
BEFORE: First element was 1.000000
AFTER: First element is 3.140000
```

When StarPU is used for the first time, the directory `$STARPU_HOME/.starpu/` is created, performance models will be stored in this directory (`STARPU_HOME`). Please note that buses are benchmarked when StarPU is launched for the first time. This may take a few minutes, or less if `libhwloc` is installed. This step is done only once per user and per machine.

2.3.4 Running a Basic StarPU Application on Microsoft Visual C

Batch files are provided to run StarPU applications under Microsoft Visual C. They are installed in `$STARPU_PATH/bin/msvc`.

To execute a StarPU application, you first need to set the environment variable `STARPU_PATH`.

```
c:\\.\.\.> cd c:\cygwin\home\ci\starpu\n
c:\\.\.\.> set STARPU_PATH=c:\cygwin\home\ci\starpu\n
c:\\.\.\.> cd bin\msvc

c:\\.\.\.> starpu_open.bat starpu_simple.c
```

The batch script will run Microsoft Visual C with a basic project file to run the given application.

The batch script `starpu_clean.bat` can be used to delete all compilation generated files. The batch script `starpu_exec.bat` can be used to compile and execute a StarPU application from the command prompt.

```
c:\\.\.\.> cd c:\cygwin\home\ci\starpu\n
c:\\.\.\.> set STARPU_PATH=c:\cygwin\home\ci\starpu\n
c:\\.\.\.> cd bin\msvc

c:\\.\.\.> starpu_exec.bat ..\\.\.\.\examples\basic_examples\hello_world.c
```

MSVC StarPU Execution

```
... /out:hello_world.exe
...
Hello world (params = {1, 2.00000})
Callback function got argument 00000042
```
2.3.5 Kernel Threads Started by StarPU

StarPU automatically binds one thread per CPU core. It does not use SMT/hyperthreading because kernels are usually already optimized for using a full core, and using hyperthreading would make kernel calibration rather random.

Since driving GPUs is a CPU-consuming task, StarPU dedicates one core per GPU.
While StarPU tasks are executing, the application is not supposed to do computations in the threads it starts itself, tasks should be used instead.
TODO: add a StarPU function to bind an application thread (e.g. the main thread) to a dedicated core (and thus disable the corresponding StarPU CPU worker).

2.3.6 Enabling OpenCL

When both CUDA and OpenCL drivers are enabled, StarPU will launch an OpenCL worker for NVIDIA GPUs only if CUDA is not already running on them. This design choice was necessary as OpenCL and CUDA can not run at the same time on the same NVIDIA GPU, as there is currently no interoperability between them.
To enable OpenCL, you need either to disable CUDA when configuring StarPU:

```bash
$ ./configure --disable-cuda
```
or when running applications:

```bash
$ STARPU_NCUDA=0 ./application
```
OpenCL will automatically be started on any device not yet used by CUDA. So on a machine running 4 GPUS, it is therefore possible to enable CUDA on 2 devices, and OpenCL on the 2 other devices by doing so:

```bash
$ STARPU_NCUDA=2 ./application
```

2.4 Benchmarking StarPU

Some interesting benchmarks are installed among examples in `$STARPU_PATH/lib/starpu/examples/`. Make sure to try various schedulers, for instance `STARPU_SCHED=dmda`.

2.4.1 Task Size Overhead

This benchmark gives a glimpse into how long a task should be (in µs) for StarPU overhead to be low enough to keep efficiency. Running `tasks_size_overhead.sh` generates a plot of the speedup of tasks of various sizes, depending on the number of CPUs being used.
2.4.2 Data Transfer Latency

`local_pingpong` performs a ping-pong between the first two CUDA nodes, and prints the measured latency.

2.4.3 Matrix-Matrix Multiplication

`sgemm` and `dgemm` perform a blocked matrix-matrix multiplication using BLAS and cuBLAS. They output the obtained GFlops.

2.4.4 Cholesky Factorization

`cholesky_*` perform a Cholesky factorization (single precision). They use different dependency primitives.

2.4.5 LU Factorization

`lu_*` perform an LU factorization. They use different dependency primitives.

2.4.6 Simulated benchmarks

It can also be convenient to try simulated benchmarks, if you want to give a try at CPU-GPU scheduling without actually having a GPU at hand. This can be done by using the simgrid version of StarPU: first install the simgrid simulator from [http://simgrid.gforge.inria.fr/](http://simgrid.gforge.inria.fr/) (we tested with simgrid 3.11, 3.12 and 3.13, other versions may have compatibility issues), then configure StarPU with `--enable-simgrid` and rebuild and install it, and then you can simulate the performance for a few virtualized systems shipped along StarPU: attila, mirage, idgraf, and sirocco.

For instance:

```sh
$ export STARPU_PERF_MODEL_DIR=$STARPU_PATH/share/starpu/perfmodes/sampling
$ export STARPU_HOSTNAME=attila
$ $STARPU_PATH/lib/starpu/examples/cholesky_implicit -size $(960*20) -nblocks 20
```

Will show the performance of the cholesky factorization with the attila system. It will be interesting to try with different matrix sizes and schedulers.

Performance models are available for `cholesky_*, lu_*`, `*gemm`, with block sizes 320, 640, or 960 (plus 1440 for sirocco), and for stencil with block size 128x128x128, 192x192x192, and 256x256x256.
Chapter 3

Basic Examples

3.1 Hello World Using The C Extension

This section shows how to implement a simple program that submits a task to StarPU using the StarPU C extension (C Extensions). The complete example, and additional examples, is available in the directory gcc-plugin/examples of the StarPU distribution. A similar example showing how to directly use the StarPU's API is shown in Hello World Using StarPU's API.

GCC from version 4.5 permit to use the StarPU GCC plug-in (C Extensions). This makes writing a task both simpler and less error-prone. In a nutshell, all it takes is to declare a task, declare and define its implementations (for CPU, OpenCL, and/or CUDA), and invoke the task like a regular C function. The example below defines my_task which has a single implementation for CPU:

```c
#include <stdio.h>

/* Task declaration. */
static void my_task (int x) __attribute__ ((task));

/* Definition of the CPU implementation of 'my_task'. */
static void my_task (int x)
{
    printf("Hello, world! With x = %d\n", x);
}

int main ()
{
    /* Initialize StarPU. */
    #pragma starpu initialize
    /* Do an asynchronous call to 'my_task'. */
    my_task (42);
    /* Wait for the call to complete. */
    #pragma starpu wait
    /* Terminate. */
    #pragma starpu shutdown
    return 0;
}
```

The code can then be compiled and linked with GCC and the flag -fplugin:

```
$ gcc -pkg-config starpu-1.3 --cflags' hello-starpu.c \ 
    -fplugin='pkg-config starpu-1.3 --variable=gccplugin' \ 
    'pkg-config starpu-1.3 --libs'
```

The code can also be compiled without the StarPU C extension and will behave as a normal sequential code.

```
$ gcc hello-starpu.c
$ ./a.out
hello-starpu.c:33:1: warning: 'task' attribute directive ignored [-Wattributes]
Hello, world! With x = 42
```

As can be seen above, the C extensions allows programmers to use StarPU tasks by essentially annotating "regular" C code.
3.2 Hello World Using StarPU’s API

This section shows how to achieve the same result as in the previous section using StarPU’s standard C API.

3.2.1 Required Headers

The header `starpu.h` should be included in any code using StarPU.

```c
#include <starpu.h>
```

3.2.2 Defining A Codelet

A codelet is a structure that represents a computational kernel. Such a codelet may contain an implementation of the same kernel on different architectures (e.g. CUDA, x86, ...). For compatibility, make sure that the whole structure is properly initialized to zero, either by using the function `starpu_codelet_init()`, or by letting the compiler implicitly do it as exemplified below.

The field `starpu_codelet::nbuffers` specifies the number of data buffers that are manipulated by the codelet: here the codelet does not access or modify any data that is controlled by our data management library. We create a codelet which may only be executed on CPUs. When a CPU core will execute a codelet, it will call the function `cpu_func`, which must have the following prototype:

```c
void (*cpu_func)(void *buffers[], void *cl_arg);
```

In this example, we can ignore the first argument of this function which gives a description of the input and output buffers (e.g. the size and the location of the matrices) since there is none. We also ignore the second argument which is a pointer to optional arguments for the codelet.

```c
void cpu_func(void *buffers[], void *cl_arg)
{
    printf("Hello world\n");
}
```

```c
def struct starpu_codelet cl =
{
    .cpu_funcs = { cpu_func },
    .nbuffers = 0
};
```

3.2.3 Submitting A Task

Before submitting any tasks to StarPU, `starpu_init()` must be called. The `NULL` argument specifies that we use the default configuration. Tasks can then be submitted until the termination of StarPU – done by a call to `starpu←shutdown()`.

In the example below, a task structure is allocated by a call to `starpu_task_create()`. This function allocates and fills the task structure with its default settings, it does not submit the task to StarPU.

The field `starpu_task::cl` is a pointer to the codelet which the task will execute: in other words, the codelet structure describes which computational kernel should be offloaded on the different architectures, and the task structure is a wrapper containing a codelet and the piece of data on which the codelet should operate.

If the field `starpu_task::synchronous` is non-zero, task submission will be synchronous: the function `starpu←submit()` will not return until the task has been executed. Note that the function `starpu←shutdown()` does not guarantee that asynchronous tasks have been executed before it returns, `starpu←wait_for_all()` can be used to this effect, or data can be unregistered (`starpu←data←unregister()`), which will implicitly wait for all the tasks scheduled to work on it, unless explicitly disabled thanks to `starpu←data←set←default←sequential←consistency←flag()` or `starpu←data←set←sequential←consistency←flag()`.

```c
int main(int argc, char **argv)
{
    /* initialize StarPU */
    starpu←init(NULL);

    struct starpu←task ←task ←starpu←task←create();

    /* Pointer to the codelet defined above */
    task←cl ←icl;

    /* starpu←task←submit will be a blocking call. If unset, starpu←task←wait() needs to be called after submitting the task. */
    task←synchronous ←1;
}
```
3.2 Hello World Using StarPU’s API

```c
/* submit the task to StarPU */
starpu_task_submit(task);

/* terminate StarPU */
starpu_shutdown();

return 0;
```

3.2.4 Execution Of Hello World

$ make hello_world
cc $(pkg-config --cflags starpu-1.3) hello_world.c -o hello_world $(pkg-config --libs starpu-1.3)
$ ./hello_world
Hello world

3.2.5 Passing Arguments To The Codelet

The optional field `starpu_task::cl_arg` field is a pointer to a buffer (of size `starpu_task::cl_arg_size`) with some parameters for the kernel described by the codelet. For instance, if a codelet implements a computational kernel that multiplies its input vector by a constant, the constant could be specified by the means of this buffer, instead of registering it as a StarPU data. It must however be noted that StarPU avoids making copy whenever possible and rather passes the pointer as such, so the buffer which is pointed at must be kept allocated until the task terminates, and if several tasks are submitted with various parameters, each of them must be given a pointer to their own buffer.

```c
struct params
{
    int i;
    float f;
};

void cpu_func(void *buffers[], void *cl_arg)
{
    struct params *params = cl_arg;
    printf("Hello world (params = {%i, %f})\n", params->i, params->f);
}
```

As said before, the field `starpu_codelet::nbuffers` specifies the number of data buffers which are manipulated by the codelet. It does not count the argument — the parameter `cl_arg` of the function `cpu_func` — since it is not managed by our data management library, but just contains trivial parameters.

Be aware that this may be a pointer to a copy of the actual buffer, and not the pointer given by the programmer: if the codelet modifies this buffer, there is no guarantee that the initial buffer will be modified as well: this for instance implies that the buffer cannot be used as a synchronization medium. If synchronization is needed, data has to be registered to StarPU, see Vector Scaling Using StarPU’s API.

```c
int main(int argc, char **argv)
{
    /* initialize StarPU */
    starpu_init(NULL);

    struct starpu_task *task = starpu_task_create();
    task->cl = &cl; /* Pointer to the codelet defined above */

    struct params params = { 1, 2.0f }; 
    task->cl_arg = &params;
    task->cl_arg_size = sizeof(params);

    /* starpu_task_submit will be a blocking call */
    task->synchronous = 1;

    /* submit the task to StarPU */
    starpu_task_submit(task);

    /* terminate StarPU */
    starpu_shutdown();

    return 0;
}
```

$ make hello_world
cc $(pkg-config --cflags starpu-1.3) hello_world.c -o hello_world $(pkg-config --libs starpu-1.3)
$ ./hello_world
Hello world (params = {1, 2.000000})

Generated by Doxygen
3.2.6 Defining A Callback

Once a task has been executed, an optional callback function `starpu_task::callback_func` is called when defined. While the computational kernel could be offloaded on various architectures, the callback function is always executed on a CPU. The pointer `starpu_task::callback_arg` is passed as an argument of the callback function. The prototype of a callback function must be:

```c
void (*callback_function)(void *
```

```c
task->callback_func = callback_func;
task->callback_arg = 0x42;
```

```c
printf("Callback function (arg %x)\n", callback_arg);
}
```

```c
int main(int argc, char **argv)
{
    /* initialize StarPU */
    starpu_init(NULL);
    struct starpu_task *task = starpu_task_create();
    task->cl = &cl; /* Pointer to the codelet defined above */
    task->callback_func = callback_func;
    task->callback_arg = 0x42;
    /* starpu_task_submit will be a blocking call */
    task->synchronous = 1;
    /* submit the task to StarPU */
    starpu_task_submit(task);
    /* terminate StarPU */
    starpu_shutdown();
    return 0;
}
```

$ make hello_world
`cc $(pkg-config --cflags starpu-1.3) hello_world.c -o hello_world $(pkg-config --libs starpu-1.3)`

Then execute:
```
$ ./hello_world
Hello world
Callback function (arg 42)
```

3.2.7 Where To Execute A Codelet

```c
struct starpu_codelet cl =
{
    .where = STARPU_CPU,
    .cpu_funcs = { cpu_func },
    .cpu_funcs_name = { "cpu_func" },
    .nbuffers = 0
};
```

We create a codelet which may only be executed on the CPUs. The optional field `starpu_codelet::where` is a bitmask which defines where the codelet may be executed. Here, the value `STARPU_CPU` means that only CPUs can execute this codelet. When the optional field `starpu_codelet::where` is unset, its value is automatically set based on the availability of the different fields `XXX_funcs`.

TODO: explain `starpu_codelet::cpu_funcs_name`

3.3 Vector Scaling Using the C Extension

The previous example has shown how to submit tasks. In this section, we show how StarPU tasks can manipulate data.

We will first show how to use the C language extensions provided by the GCC plug-in (C Extensions). The complete example, and additional examples, is available in the directory `gcc-plugin/examples` of the StarPU distribution. These extensions map directly to StarPU’s main concepts: tasks, task implementations for CPU, OpenCL, or CUDA, and registered data buffers. The standard C version that uses StarPU’s standard C programming interface is given in `Vector Scaling Using StarPU’s API`.

First of all, the vector-scaling task and its simple CPU implementation has to be defined:

```c
/* Declare the 'vector_scal' task. */
static void vector_scal (unsigned size, float vector[size], float factor) __attribute__ ((task));
```
3.3 Vector Scaling Using the C Extension

```c
/* Define the standard CPU implementation. */
static void vector_scal (unsigned size, float vector[size], float factor)
{
    unsigned i;
    for (i = 0; i < size; i++)
        vector[i] *= factor;
}

Next, the body of the program, which uses the task defined above, can be implemented:

```c
int main (void)
{
    #pragma starpu initialize
    #define NX 0x100000
    #define FACTOR 3.14
    {
        float vector[NX]
            __attribute__((heap_allocated, registered));
        size_t i;
        for (i = 0; i < NX; i++)
            vector[i] = (float) i;
        vector_scal (NX, vector, FACTOR);
    } /* VECTOR is automatically freed here. */
    #pragma starpu wait
    #pragma starpu shutdown

    return valid ? EXIT_SUCCESS : EXIT_FAILURE;
}
```

The function `main` above does several things:

- It initializes StarPU.
- It allocates `vector` in the heap; it will automatically be freed when its scope is left. Alternatively, good old `malloc` and `free` could have been used, but they are more error-prone and require more typing.
- It registers the memory pointed to by `vector`. Eventually, when OpenCL or CUDA task implementations are added, this will allow StarPU to transfer the memory region between GPUs and the main memory. Removing this pragma is an error.
- It invokes the task `vector_scal`. The invocation looks the same as a standard C function call. However, it is an asynchronous invocation, meaning that the actual call is performed in parallel with the caller’s continuation.
- It waits for the termination of the asynchronous call `vector_scal`.
- Finally, StarPU is shut down.

The program can be compiled and linked with GCC and the flag `-fplugin`:

```
$ gcc 'pkg-config starpu-1.3 --cflags' vector_scal.c
    -fplugin='pkg-config starpu-1.3 --variable=gccplugin'
    'pkg-config starpu-1.3 --libs'
```

And voilà!

3.3.1 Adding an OpenCL Task Implementation

Now, this is all fine and great, but you certainly want to take advantage of these newfangled GPUs that your lab just bought, don’t you?

So, let’s add an OpenCL implementation of the task `vector_scal`. We assume that the OpenCL kernel is available in a file, `vector_scal_opencl_kernel.cl`, not shown here. The OpenCL task implementation is similar to the one used with the standard C API (Definition of the OpenCL Kernel). It is declared and defined in our C file like this:
/* The OpenCL programs, loaded from 'main' (see below). */

static struct starpu_opencl_program cl_programs;

static void vector_scal_opencl (unsigned size, float vector[size], float factor)
__attribute__ ((task_implementation ("opencl", vector_scal)));

int id, devid, err;
cl_kernel kernel;
cl_command_queue queue;
cl_event event;

typedef float mem_t;
mem_t* val = (mem_t*) vector;

size_t global = 1, local = 1;

extern void vector_scal_cuda (unsigned size, float vector[size], float factor)
__attribute__ ((task_implementation ("cuda", vector_scal)));

The OpenCL kernel itself must be loaded from main, sometime after the pragma initialize:

starpu_opencl_load_opencl_from_file ("vector_scal_opencl_kernel.cl", &cl_programs, "");

And that's it. The task vector_scal now has an additional implementation, for OpenCL, which StarPU's scheduler may choose to use at runtime. Unfortunately, the vector_scal_opencl above still has to go through the common OpenCL boilerplate; in the future, additional extensions will automate most of it.

3.3.2 Adding a CUDA Task Implementation

Adding a CUDA implementation of the task is very similar, except that the implementation itself is typically written in CUDA, and compiled with nvcc. Thus, the C file only needs to contain an external declaration for the task implementation:

extern void vector_scal_cuda (unsigned size, float vector[size], float factor)
__attribute__ ((task_implementation ("cuda", vector_scal)));

The actual implementation of the CUDA task goes into a separate compilation unit, in a .cu file. It is very close to the implementation when using StarPU's standard C API (Definition of the CUDA Kernel).
3.4 Vector Scaling Using StarPU’s API

This section shows how to achieve the same result as explained in the previous section using StarPU’s standard C API. The full source code for this example is given in Full source code for the ‘Scaling a Vector’ example.

### 3.4.1 Source Code of Vector Scaling

Programmers can describe the data layout of their application so that StarPU is responsible for enforcing data coherency and availability across the machine. Instead of handling complex (and non-portable) mechanisms to perform data movements, programmers only declare which piece of data is accessed and/or modified by a task, and StarPU makes sure that when a computational kernel starts somewhere (e.g. on a GPU), its data are available locally.

Before submitting those tasks, the programmer first needs to declare the different pieces of data to StarPU using the functions `starpu_*_data_register`. To ease the development of applications for StarPU, it is possible to describe multiple types of data layout. A type of data layout is called an interface. There are different predefined interfaces available in StarPU: here we will consider the vector interface.

The following lines show how to declare an array of \( NX \) elements of type `float` using the vector interface:

```c
float vector[NX];
starpu_data_handle_t vector_handle;
starpu_vector_data_register(&vector_handle, STARPU_MAIN_RAM, (uintptr_t)vector, NX, sizeof(vector[0]));
```

The first argument, called the data handle, is an opaque pointer which designates the array within StarPU. This is also the structure which is used to describe which data is used by a task. The second argument is the node number where the data originally resides. Here it is `STARPU_MAIN_RAM` since the array `vector` is in the main memory. Then comes the pointer `vector` where the data can be found in main memory, the number of elements in the vector and the size of each element. The following shows how to construct a StarPU task that will manipulate the vector and a constant factor.

```c
float factor = 3.14;
struct starpu_task *task = starpu_task_create();
```

Since the factor is a mere constant float value parameter, it does not need a preliminary registration, and can just be passed through the pointer `starpu_task::cl_arg` like in the previous example. The vector parameter is described by its handle. `starpu_task::handles` should be set with the handles of the data, the access modes for the data are defined in the field `starpu_codelet::modes` (`STARPU_R` for read-only, `STARPU_W` for write-only and `STARPU_RW` for read and write access).

The definition of the codelet can be written as follows:

```c
void scal_cpu_func(void *buffers[], void *cl_arg)
{
    unsigned i;
    float *factor = cl_arg;
    // length of the vector */
    unsigned n = STARPU_VECTOR_GET_NX(buffers[0]);
```
Basic Examples

```c
/* CPU copy of the vector pointer */
float *val = (float *)STARPU_VECTOR_GET_PTR(buffers[0]);

for (i = 0; i < n; i++)
  val[i] *= factor;
```

```c
struct starpu_codelet cl =
{
  .cpu_funcs = { scal_cpu_func },
  .cpu_funcs_name = { "scal_cpu_func" },
  .nbuffers = 1,
  .modes = { STARPU_RW }
};
```

The first argument is an array that gives a description of all the buffers passed in the array `starpu_task::handles`. The size of this array is given by the field `starpu_codelet::nbuffers`. For the sake of genericity, this array contains pointers to the different interfaces describing each buffer. In the case of the `vector interface`, the location of the vector (resp. its length) is accessible in the `starpu_vector_interface::ptr` (resp. `starpu_vector_interface::nx`) of this interface. Since the vector is accessed in a read-write fashion, any modification will automatically affect future accesses to this vector made by other tasks.

The second argument of the function `scal_cpu_func` contains a pointer to the parameters of the codelet (given in `starpu_task::cl_arg`), so that we read the constant factor from this pointer.

### 3.4.2 Execution of Vector Scaling

```bash
$ make vector_scal
cc $(pkg-config --cflags starpu-1.3) vector_scal.c -o vector_scal $(pkg-config --libs starpu-1.3)
$ ./vector_scal
0.000000 3.000000 6.000000 9.000000 12.000000
```

### 3.5 Vector Scaling on an Hybrid CPU/GPU Machine

Contrary to the previous examples, the task submitted in this example may not only be executed by the CPUs, but also by a CUDA device.

#### 3.5.1 Definition of the CUDA Kernel

The CUDA implementation can be written as follows. It needs to be compiled with a CUDA compiler such as nvcc, the NVIDIA CUDA compiler driver. It must be noted that the vector pointer returned by `STARPU_VECTOR_GET_PTR` is here a pointer in GPU memory, so that it can be passed as such to the kernel call `vector_mult_cuda`.

```c
#include <starpu.h>

static __global__ void vector_mult_cuda(unsigned n, float *val, float factor)
{
  unsigned i = blockIdx.x*blockDim.x + threadIdx.x;
  if (i < n)
    val[i] *= factor;
}

extern "C" void scal_cuda_func(void *buffers[], void *args)
{
  float *factor = (float *)args;
  /* length of the vector */
  unsigned n = STARPU_VECTOR_GET_NX(buffers[0]);
  /* local copy of the vector pointer */
  float *val = (float *)STARPU_VECTOR_GET_PTR(buffers[0]);
  unsigned threads_per_block = 64;
  unsigned nblocks = (n + threads_per_block-1) / threads_per_block;
  vector_mult_cuda<<<nblocks,threads_per_block, 0, starpu_cuda_get_local_stream()>>>(n, val,
  *factor);
  cudaStreamSynchronize(starpu_cuda_get_local_stream());
}
```

#### 3.5.2 Definition of the OpenCL Kernel

The OpenCL implementation can be written as follows. StarPU provides tools to compile a OpenCL kernel stored in a file.
3.5 Vector Scaling on an Hybrid CPU/GPU Machine

__kernel void vector_mult_opencl(int nx, __global float* val, float factor)
{
    const int i = get_global_id(0);
    if (i < nx)
    {
        val[i] *= factor;
    }
}

Contrary to CUDA and CPU, STARPU_VECTOR_GET_DEV_HANDLE has to be used, which returns a cl_mem (which is not a device pointer, but an OpenCL handle), which can be passed as such to the OpenCL kernel. The difference is important when using partitioning, see Partitioning Data.

#include <starpu.h>

extern struct starpu_opencl_program programs;

void scal_opencl_func(void *buffers[], void *_args)
{
    float *factor = _args;
    int id, devid, err; /* OpenCL specific code */
    cl_kernel kernel; /* OpenCL specific code */
    cl_command_queue queue; /* OpenCL specific code */
    cl_event event; /* OpenCL specific code */

    /* length of the vector */
    unsigned n = STARPU_VECTOR_GET_NX(buffers[0]);
    /* OpenCL copy of the vector pointer */
    cl_mem val = (cl_mem)STARPU_VECTOR_GET_DEV_HANDLE(buffers[0]);

    { /* OpenCL specific code */
      id = starpu_worker_get_id();
      devid = starpu_worker_get_devid(id);
      err = starpu_opencl_load_kernel(&kernel, &queue, &programs,
                                      "vector_mult_opencl", /* Name of the codelet */
                                      &devid);
      if (err != CL_SUCCESS) STARPU_OPENCL_REPORT_ERROR(err);
      err = clSetKernelArg(kernel, 0, sizeof(n), &n);
      err |= clSetKernelArg(kernel, 1, sizeof(val), &val);
      err |= clSetKernelArg(kernel, 2, sizeof(*factor), factor);
      if (err) STARPU_OPENCL_REPORT_ERROR(err);
    }

    { /* OpenCL specific code */
      size_t global=n;
      size_t local;
      size_t s;
      cl_device_id device;
      starpu_opencl_get_device(devid, &device);
      err = clGetKernelWorkGroupInfo (kernel, device, CL_KERNEL_WORK_GROUP_SIZE, sizeof(local), &local, &s);
      if (err != CL_SUCCESS) STARPU_OPENCL_REPORT_ERROR(err);
      if (local > global) local=global;
      err = clEnqueueNDRangeKernel(queue, kernel, 1, NULL, &global, &local, 0, NULL, &event);
      if (err != CL_SUCCESS) STARPU_OPENCL_REPORT_ERROR(err);
    }

    { /* OpenCL specific code */
      clFinish(queue);
      starpu_opencl_collect_stats(event);
      clReleaseEvent(event);
      starpu_opencl_release_kernel(kernel);
    }
}

3.5.3 Definition of the Main Code

The CPU implementation is the same as in the previous section. Here is the source of the main application. You can notice that the fields starpu_codelet::cuda_funcs and starpu_codelet::opencl_funcs are set to define the pointers to the CUDA and OpenCL implementations of the task.

/*
 * This example demonstrates how to use StarPU to scale an array by a factor.
 * It shows how to manipulate data with StarPU’s data management library.
 * 1- how to declare a piece of data to StarPU (starpu_vector_data_register)
 * 2- how to declare how data are accessed by a task (task->handles[0])
 * 3- how a kernel can manipulate the data (buffers[0].vector.ptr)
 */
#include <starpu.h>

#define NX 2048

extern void scal_cpu_func(void *buffers[], void *__args);
extern void scal_sse_func(void *buffers[], void *__args);
extern void scal_cuda_func(void *buffers[], void *__args);
extern void scal_opencl_func(void *buffers[], void *__args);

static struct starpu_codelet cl =
{
    .where = STARPU_CPU | STARPU_CUDA | STARPU_OPENCL,
    /* CPU implementation of the codelet */
    .cpu_funcs = { scal_cpu_func, scal_sse_func },
    .cpu_funcs_name = { "scal_cpu_func", "scal_sse_func" },
#ifdef STARPU_USE_CUDA
    /* CUDA implementation of the codelet */
    .cuda_funcs = { scal_cuda_func },
#endif
#ifdef STARPU_USE_OPENCL
    /* OpenCL implementation of the codelet */
    .opencl_funcs = { scal_opencl_func },
#endif
    .nbuffers = 1,
    .modes = { STARPU_RW }
};

int main(int argc, char **argv)
{
    float vector[NX];
    unsigned i;
    for (i = 0; i < NX; i++)
        vector[i] = 1.0f;

    fprintf(stderr, "BEFORE: First element was %f\n", vector[0]);

    starpu_init(NULL);
#ifdef STARPU_USE_OPENCL
    starpu_opencl_load_opencl_from_file("examples/basic_examples/vector_scal_opencl_kernel.cl", &programs, NULL);
#endif

    starpu_data_handle_t vector_handle;
    starpu_vector_data_register(&vector_handle, STARPU_MAIN_RAM, (uintptr_t)vector, NX, sizeof(vector[0]));

    float factor = 3.14;

    struct starpu_task *task = starpu_task_create();
    task->synchronous = 1;
    task->cl = &cl;
    task->cl_arg = &factor;
    task->cl_arg_size = sizeof(factor);

    starpu_task_submit(task);
}

Generated by Doxygen
3.5 Vector Scaling on an Hybrid CPU/GPU Machine

```c
starpu_task_submit(task);

/* StarPU does not need to manipulate the array anymore so we can stop
 * monitoring it */
starpu_data_unregister(vector_handle);

#ifdef STARPU_USE_OPENCL
    starpu_openc1_unload_opencl(sprograms);
#endif

/* terminate StarPU, no task can be submitted after */
starpu_shutdown();

fprintf(stderr, "AFTER First element is %f\n", vector[0]);
return 0;
```

3.5.4 Execution of Hybrid Vector Scaling

The Makefile given at the beginning of the section must be extended to give the rules to compile the CUDA source code. Note that the source file of the OpenCL kernel does not need to be compiled now, it will be compiled at run-time when calling the function `starpu_opencl_load_opencl_from_file()`.

CFLAGS += $(shell pkg-config --cflags starpu-1.3)
LDFLAGS += $(shell pkg-config --libs starpu-1.3)
CC = gcc

```make
vector_scal: vector_scal.o vector_scal_cpu.o vector_scal_cuda.o vector_scal_opencl.o
%.o: %.cu
    nvcc $(CFLAGS) $< -c $@

clean:
    rm -f vector_scal *.o
```

$ make

and to execute it, with the default configuration:

$ ./vector_scal
0.000000 3.000000 6.000000 9.000000 12.000000

or for example, by disabling CPU devices:

$ STARPU_NCPU=0 ./vector_scal
0.000000 3.000000 6.000000 9.000000 12.000000

or by disabling CUDA devices (which may permit to enable the use of OpenCL, see Enabling OpenCL):

$ STARPU_NCUDA=0 ./vector_scal
0.000000 3.000000 6.000000 9.000000 12.000000

Check List When Performance Are Not There

TODO: improve!
To achieve good performance, we give below a list of features which should be checked.
For a start, you can use Offline Performance Tools to get a Gantt chart which will show roughly where time is spent, and focus correspondingly.

5.1 Check Task Size

Make sure that your tasks are not too small, because the StarPU runtime overhead is not completely zero. You can run the tasks_size_overhead.sh script to get an idea of the scalability of tasks depending on their duration (in µs), on your own system.
Typically, 10µs-ish tasks are definitely too small, the CUDA overhead itself is much bigger than this.
1ms-ish tasks may be a good start, but will not necessarily scale to many dozens of cores, so it's better to try to get 10ms-ish tasks.
Tasks durations can easily be observed when performance models are defined (see Performance Model Example) by using the starpu_perfmodel_plot or starpu_perfmodel_display tool (see Performance Of Codelets)
When using parallel tasks, the problem is even worse since StarPU has to synchronize the execution of tasks.

5.2 Configuration Which May Improve Performance

The --enable-fast configuration option disables all assertions. This makes StarPU more performant for really small tasks by disabling all sanity checks. Only use this for measurements and production, not for development, since this will drop all basic checks.

5.3 Data Related Features Which May Improve Performance

5.6 **CUDA-specific Optimizations**

For proper overlapping of asynchronous GPU data transfers, data has to be pinned by CUDA. Data allocated with \texttt{starpu_malloc()} is always properly pinned. If the application is registering to StarPU some data which has not been allocated with \texttt{starpu_malloc()}, it should use \texttt{starpu_memory_pin()} to pin it. Due to CUDA limitations, StarPU will have a hard time overlapping its own communications and the codelet computations if the application does not use a dedicated CUDA stream for its computations instead of the default stream, which synchronizes all operations of the GPU. StarPU provides one by the use of \texttt{starpu_cuda_get_local_stream()} which can be used by all CUDA codelet operations to avoid this issue. For instance:

```c
func <<<grid,block,0,starpu_cuda_get_local_stream()>>> (foo, bar);
cudaStreamSynchronize(starpu_cuda_get_local_stream());
```

Unfortunately, some CUDA libraries do not have stream variants of kernels. This will lower the potential for overlapping.

Calling \texttt{starpu_cublas_init()} makes StarPU already do appropriate calls for the CUBLAS library. Some libraries like Magma may however change the current stream of CUBLAS v1, one then has to call \texttt{cublasSetKernelStream(starpu_cuda_get_local_stream())} at the beginning of the codelet to make sure that CUBLAS is really using the proper stream. When using CUBLAS v2, \texttt{starpu_cublas_get_local_handle()} can be called to queue CUBLAS kernels with the proper configuration.

Similarly, calling \texttt{starpu cusparse_init()} makes StarPU create CUSPARSE handles on each CUDA device, \texttt{starpu_cusparse_get_local_handle()} can then be used to queue CUSPARSE kernels with the proper configuration.

If the kernel can be made to only use this local stream or other self-allocated streams, i.e. the whole kernel submission can be made asynchronous, then one should enable asynchronous execution of the kernel. This means setting the flag \texttt{STARPU_CUDA_ASYNC} in the corresponding field \texttt{starpu_codelet::cuda_flags}, and dropping the \texttt{cudaStreamSynchronize()} call at the end of the \texttt{cuda_func} function, so that it returns immediately after having queued the kernel to the local stream. That way, StarPU will be able to submit and complete data transfers while kernels are executing, instead of only at each kernel submission. The kernel just has to make sure that StarPU can use the local stream to synchronize with the kernel startup and completion.

If the kernel uses its own non-default stream, one can synchronize this stream with the StarPU-provided stream this way:

```c
cudaEvent_t event;
call_kernel_with_its_own_stream();
cudaEventCreateWithFlags(&event, cudaEventDisableTiming);
cudaEventRecord(event, get_kernel_stream());
cudaStreamWaitEvent(starpu_cuda_get_local_stream(), event, 0);
cudaEventDestroy(event);
```

This code makes the StarPU-provided stream wait for a new event, which will be triggered by the completion of the kernel.

Using the flag \texttt{STARPU_CUDA_ASYNC} also permits to enable concurrent kernel execution, on cards which support it (Kepler and later, notably). This is enabled by setting the environment variable \texttt{STARPU_NWORKER_PER_CUDA} to the number of kernels to execute concurrently. This is useful when kernels are small and do not feed the whole GPU with threads to run.

Concerning memory allocation, you should really not use \texttt{cudaMalloc/cudaFree} within the kernel, since \texttt{cudaFree} introduces a awfully lot of synchronizations within CUDA itself. You should instead add a parameter to the codelet with the \texttt{STARPU_SCRATCH} mode access. You can then pass to the task a handle registered with the desired size but with the NULL pointer, that handle can even be the shared between tasks, StarPU will allocate per-task data on the fly before task execution, and reuse the allocated data between tasks.

See \texttt{examples/pi/pi_redux.c} for an example of use.

5.7 **OpenCL-specific Optimizations**

If the kernel can be made to only use the StarPU-provided command queue or other self-allocated queues, i.e. the whole kernel submission can be made asynchronous, then one should enable asynchronous execution of the kernel. This means setting the flag \texttt{STARPU_OPENCL_ASYNC} in the corresponding field \texttt{starpu_codelet::opencl_flags} and dropping the \texttt{clFinish()} and \texttt{starpu_opencl_collect_stats()} calls at the end of the kernel, so that it returns immediately after having queued the kernel to the provided queue. That way, StarPU will be able to submit...
and complete data transfers while kernels are executing, instead of only at each kernel submission. The kernel just has to make sure that StarPU can use the command queue it has provided to synchronize with the kernel startup and completion.

5.8 Detecting Stuck Conditions

It may happen that for some reason, StarPU does not make progress for a long period of time. Reasons are sometimes due to contention inside StarPU, but sometimes this is due to external reasons, such as stuck MPI driver, or CUDA driver, etc.

export STARPU_WATCHDOG_TIMEOUT=10000 (STARPU_WATCHDOG_TIMEOUT)

allows to make StarPU print an error message whenever StarPU does not terminate any task for 10ms, but lets the application continue normally. In addition to that,

export STARPU_WATCHDOG_CRASH=1 (STARPU_WATCHDOG_CRASH)

raises SIGABRT in this condition, thus allowing to catch the situation in gdb. It can also be useful to type handle SIGABRT nopass in gdb to be able to let the process continue, after inspecting the state of the process.

5.9 How to Limit Memory Used By StarPU And Cache Buffer Allocations

By default, StarPU makes sure to use at most 90% of the memory of GPU devices, moving data in and out of the device as appropriate and with prefetch and writeback optimizations. Concerning the main memory, by default it will not limit its consumption, since by default it has nowhere to push the data to when memory gets tight. This also means that by default StarPU will not cache buffer allocations in main memory, since it does not know how much of the system memory it can afford.

In the case of GPUs, the STARPU_LIMIT_CUDA_MEM, STARPU_LIMIT_CUDA_devid_MEM, STARPU_LIMIT_OPENCL_MEM, and STARPU_LIMIT_OPENCL_devid_MEM environment variables can be used to control how much (in MiB) of the GPU device memory should be used at most by StarPU (their default values are 90% of the available memory).

In the case of the main memory, the STARPU_LIMIT_CPU_MEM environment variable can be used to specify how much (in MiB) of the main memory should be used at most by StarPU for buffer allocations. This way, StarPU will be able to cache buffer allocations (which can be a real benefit if a lot of buffers are involved, or if allocation fragmentation can become a problem), and when using Out Of Core, StarPU will know when it should evict data out to the disk.

It should be noted that by default only buffer allocations automatically done by StarPU are accounted here, i.e. allocations performed through starpu_malloc_on_node() which are used by the data interfaces (matrix, vector, etc.). This does not include allocations performed by the application through e.g. malloc(). It does not include allocations performed through starpu_malloc() either, only allocations performed explicitly with the STARPU_MALLOC_COUNT environment variables.

are taken into account. If the application wants to make StarPU aware of its own allocations, so that StarPU knows precisely how much data is allocated, and thus when to evict allocation caches or data out to the disk, starpu_memory_allocate() can be used to specify an amount of memory to be accounted for. starpu_memory_deallocate() can be used to account freed memory back. Those can for instance be used by data interfaces with dynamic data buffers: instead of using starpu_malloc_on_node(), they would dynamically allocate data with malloc/realloc, and notify starpu of the delta thanks to starpu_memory_allocate() and starpu_memory_deallocate() calls. starpu_memory_get_total() and starpu_memory_get_available() can be used to get an estimation of how much memory is available. starpu_memory_wait_available() can also be used to block until an amount of memory becomes available, but it may be preferable to call

starpu_memory_allocate(STARPU_MEMORY_WAIT)

to reserve this amount immediately.

5.10 How To Reduce The Memory Footprint Of Internal Data Structures

It is possible to reduce the memory footprint of the task and data internal structures of StarPU by describing the shape of your machine and/or your application at the configure step.
To reduce the memory footprint of the data internal structures of StarPU, one can set the --enable-maxcpus, --enable-maxnumanodes, --enable-maxcudadev, --enable-maxopencldev and --enable-maxnodes configure parameters to give StarPU the architecture of the machine it will run on, thus tuning the size of the structures to the machine.

To reduce the memory footprint of the task internal structures of StarPU, one can set the --enable-maxbuffers configure parameter to give StarPU the maximum number of buffers that a task can use during an execution. For example, in the Cholesky factorization (dense linear algebra application), the GEMM task uses up to 3 buffers, so it is possible to set the maximum number of task buffers to 3 to run a Cholesky factorization on StarPU.

The size of the various structures of StarPU can be printed by tests/microbenches/display_structures_size.

It is also often useless to submit all the tasks at the same time. One can make the starpu_task_submit() function block when a reasonable given number of tasks have been submitted, by setting the STARPU_LIMIT_MIN_SUBMITTED_TASKS and STARPU_LIMIT_MAX_SUBMITTED_TASKS environment variables, for instance:

```bash
export STARPU_LIMIT_MIN_SUBMITTED_TASKS=9000
export STARPU_LIMIT_MAX_SUBMITTED_TASKS=10000
```

To make StarPU block submission when 10000 tasks are submitted, and unblock submission when only 9000 tasks are still submitted, i.e. 1000 tasks have completed among the 10000 which were submitted when submission was blocked. Of course this may reduce parallelism if the threshold is set too low. The precise balance depends on the application task graph.

An idea of how much memory is used for tasks and data handles can be obtained by setting the STARPU_MAX_MEMORY_USE environment variable to 1.

### 5.11 How To Reuse Memory

When your application needs to allocate more data than the available amount of memory usable by StarPU (given by starpu_memory_get_available()), the allocation cache system can reuse data buffers used by previously executed tasks. For this system to work with MPI tasks, you need to submit tasks progressively instead of as soon as possible, because in the case of MPI receives, the allocation cache check for reusing data buffers will be done at submission time, not at execution time.

You have two options to control the task submission flow. The first one is by controlling the number of submitted tasks during the whole execution. This can be done whether by setting the environment variables STARPU_LIMIT_MIN_SUBMITTED_TASKS and STARPU_LIMIT_MAX_SUBMITTED_TASKS to tell StarPU when to stop submitting tasks and when to wake up and submit tasks again, or by explicitly calling starpu_task_wait_for_n_submitted() in your application code for finest grain control (for example, between two iterations of a submission loop).

The second option is to control the memory size of the allocation cache. This can be done in the application by using jointly starpu_memory_get_available() and starpu_memory_wait_available() to submit tasks only when there is enough memory space to allocate the data needed by the task, i.e when enough data are available for reuse in the allocation cache.

### 5.12 Performance Model Calibration

Most schedulers are based on an estimation of codelet duration on each kind of processing unit. For this to be possible, the application programmer needs to configure a performance model for the codelets of the application (see Performance Model Example for instance). History-based performance models use on-line calibration. StarPU will automatically calibrate codelets which have never been calibrated yet, and save the result in $STARPU_HOME/.starpu/sampling/codelets. The models are indexed by machine name.

By default, StarPU stores separate performance models according to the hostname of the system. To avoid having to calibrate performance models for each node of a homogeneous cluster for instance, the model can be shared by using export STARPU_HOSTNAME=some_global_name (STARPU_HOSTNAME), where some_global_name is the name of the cluster for instance, which thus overrides the hostname of the system.

By default, StarPU stores separate performance models for each GPU. To avoid having to calibrate performance models for each GPU of a homogeneous set of GPU devices for instance, the model can be shared by setting export STARPU_PERF_MODEL_HOMOGENEOUS_CUDA=1, export STARPU_PERF_MODEL_HOMOGENEOUS_OPENCL=1, export STARPU_PERF_MODEL_HOMOGENEOUS_MIC=1, export STARPU_PERF_MODEL_HOMOGENEOUS_MPI_MS=1, or export STARPU_PERF_MODEL_HOMOGENEOUS_SCC=1 (depending on your GPU device type).

Generated by Doxygen
To force continuing calibration, use `export STARPU_CALIBRATE=1` (STARPU_CALIBRATE). This may be necessary if your application has not-so-stable performance. StarPU will force calibration (and thus ignore the current result) until 10 `_STARPU_CALIBRATION_MINIMUM` measurements have been made on each architecture, to avoid badly scheduling tasks just because the first measurements were not so good. Details on the current performance model status can be obtained from the tool `starpu_perfmodel_display`: the `-l` option lists the available performance models, and the `-s` option permits to choose the performance model to be displayed. The result looks like:

```bash
$ starpu_perfmodel_display -s starpu_slu_lu_model_11
performance model for cpu_impl_0
  # hash size  flops   mean   dev  n
  914f3bef 1048576 0.000000e+00 2.503577e+04 1.982465e+02 8
  3e921964 65536   0.000000e+00  5.527003e+02 1.848114e+01 7
  e5a07e31 4096    0.000000e+00  1.717457e+01  5.190038e+00 14
...
```

Which shows that for the LU 11 kernel with a 1MiB matrix, the average execution time on CPUs was about 25ms, with a 0.2ms standard deviation, over 8 samples. It is a good idea to check this before doing actual performance measurements.

A graph can be drawn by using the tool `starpu_perfmodel_plot`:

```bash
$ starpu_perfmodel_plot -s starpu_slu_lu_model_11
4096 16384 65536 262144 1048576 4194304
$ gnuplot starpu_starpu_slu_lu_model_11.gp
$ gv starpu_starpu_slu_lu_model_11.eps
```

If a kernel source code was modified (e.g. performance improvement), the calibration information is stale and should be dropped, to re-calibrate from start. This can be done by using `export STARPU_CALIBRATE=2` (STARPU_CALIBRATE).

Note: history-based performance models get calibrated only if a performance-model-based scheduler is chosen. The history-based performance models can also be explicitly filled by the application without execution, if e.g. the application already has a series of measurements. This can be done by using `starpu_perfmodel_update_history()`, for instance:

```c
static struct starpu_perfmodel perf_model =
```

Generated by Doxygen
Check List When Performance Are Not There

```c
struct starpu_codelet cl = {
    .cuda_funcs = { cuda_func1, cuda_func2 },
    .nbuffers = 1,
    .modes = {STARPU_W},
    .model = &perf_model
};

void feed(void) {
    struct my_measure *measure;
    struct starpu_task task;
    starpu_task_init(&task);
    task.cl = &cl;
    for (measure = &measures[0]; measure < measures[last]; measure++) {
        starpu_data_handle_t handle;
        starpu_vector_data_register(&handle, -1, 0, measure->size, sizeof(float)
        starpu_task_clean(&task);
        starpu_data_unregister(handle);
    }
}
```

Measurement has to be provided in milliseconds for the completion time models, and in Joules for the energy consumption models.

5.13 Profiling

A quick view of how many tasks each worker has executed can be obtained by setting `export STARPU_WO←RKER_STATS=1 (STARPU_WORKER_STATS). This is a convenient way to check that execution did happen on accelerators, without penalizing performance with the profiling overhead.

A quick view of how much data transfers have been issued can be obtained by setting `export STARPU_BUS_STAT=1 (STARPU_BUS_STATS).

More detailed profiling information can be enabled by using `export STARPU_PROFILING=1 (STARPU_PROFILING) or by calling starpu_profiling_status_set() from the source code. Statistics on the execution can then be obtained by using `export STARPU_BUS_STATS=1` and `export STARPU_WORKER_STATS=1. More details on performance feedback are provided in the next chapter.

5.14 Overhead Profiling

**Offline Performance Tools** can already provide an idea of to what extent and which part of StarPU bring overhead on the execution time. To get a more precise analysis of the parts of StarPU which bring most overhead, `gprof` can be used.

First, recompile and reinstall StarPU with `gprof` support:

`.configure --enable-perf-debug --disable-shared --disable-build-tests --disable-build-examples

Make sure not to leave a dynamic version of StarPU in the target path: remove any remaining `libstarpu-*.so`

Then relink your application with the static StarPU library, make sure that running `ldd` on your application does not mention any libstarpu (i.e. it’s really statically-linked).

```
gcc test.c -o test $(pkg-config --cflags starpu-1.3) $(pkg-config --libs starpu-1.3)
```

Now you can run your application, and a `gmon.out` file should appear in the current directory, you can process it by running `gprof` on your application:

```
gprof ./test
```

This will dump an analysis of the time spent in StarPU functions.
Part III

StarPU Inside
Chapter 6

Tasks In StarPU

6.1 Task Granularity

Like any other runtime, StarPU has some overhead to manage tasks. Since it does smart scheduling and data management, this overhead is not always neglectable. The order of magnitude of the overhead is typically a couple of microseconds, which is actually quite smaller than the CUDA overhead itself. The amount of work that a task should do should thus be somewhat bigger, to make sure that the overhead becomes neglectable. The offline performance feedback can provide a measure of task length, which should thus be checked if bad performance are observed. To get a grasp at the scalability possibility according to task size, one can run tests/microbenchs/tasks←size_overhead.sh which draws curves of the speedup of independent tasks of very small sizes. The choice of scheduler also has impact over the overhead: for instance, the scheduler dmda takes time to make a decision, while eager does not. tasks_size_overhead.sh can again be used to get a grasp at how much impact that has on the target machine.

6.2 Task Submission

To let StarPU make online optimizations, tasks should be submitted asynchronously as much as possible. Ideally, all the tasks should be submitted, and mere calls to starpu_task_wait_for_all() or starpu_data_unregister() be done to wait for termination. StarPU will then be able to rework the whole schedule, overlap computation with communication, manage accelerator local memory usage, etc.

6.3 Task Priorities

By default, StarPU will consider the tasks in the order they are submitted by the application. If the application programmer knows that some tasks should be performed in priority (for instance because their output is needed by many other tasks and may thus be a bottleneck if not executed early enough), the field starpu_task::priority should be set to transmit the priority information to StarPU.

6.4 Task Dependencies

6.4.1 Sequential Consistency

By default, task dependencies are inferred from data dependency (sequential coherency) by StarPU. The application can however disable sequential coherency for some data, and dependencies can be specifically expressed. Setting (or unsetting) sequential consistency can be done at the data level by calling starpu_data_set_sequential←__consistency_flag() for a specific data or starpu_data_set_default_sequential_consistency_flag() for all datas. Setting (or unsetting) sequential consistency can also be done at task level by setting the field starpu_task←::sequential_consistency to 0. Sequential consistency can also be set (or unset) for each handle of a specific task, this is done by using the field starpu_task::handles_sequential_consistency. When set, its value should be an array with the number of elements being the number of handles for the task, each element of the array being the sequential consistency for the i-th
handle of the task. The field can easily be set when calling `starpu_task_insert()` with the flag `STARPU_HANDLE_S_SEQUENTIAL_CONSISTENCY`.

```c
char *seq_consistency = malloc(cl.nbuffers * sizeof(char));
seq_consistency[0] = 1;
seq_consistency[1] = 1;
seq_consistency[2] = 0;
ret = starpu_task_insert(&cl,
    STARPU_RW, handleA, STARPU_RW, handleB, STARPU_RW, handleC,
    STARPU_HANDLES_SEQUENTIAL_CONSISTENCY, seq_consistency,
0);
free(seq_consistency);
```

The internal algorithm used by StarPU to set up implicit dependency is as follows:

```c
if (sequential_consistency(task) == 1)
    for(i=0 ; i<STARPU_TASK_GET_NBUFFERS(task) ; i++)
        if (sequential_consistency(i-th data, task) == 1)
            if (sequential_consistency(i-th data) == 1)
                create_implicit_dependency(...)
```

### 6.4.2 Tasks And Tags Dependencies

One can explicitly set dependencies between tasks using `starpu_task_declare_deps_array()`. Dependencies between tasks can be expressed through tags associated to a tag with the field `starpu_task::tag_id` and using the function `starpu_tag_declare_deps()` or `starpu_tag_declare_deps_array()`.

The termination of a task can be delayed through the function `starpu_task_end_dep_add()` which specifies the number of calls to the function `starpu_task_end_dep_release()` needed to trigger the task termination.

### 6.5 Setting Many Data Handles For a Task

The maximum number of data a task can manage is fixed by the environment variable `STARPU_NMAXBUFS` which has a default value which can be changed through the configure option `--enable-maxbuffers`.

However, it is possible to define tasks managing more data by using the field `starpu_task::dyn_handles` when defining a task and the field `starpu_codelet::dyn_modes` when defining the corresponding codelet.

```c
enum starpu_data_access_mode modes[STARPU_NMAXBUFS+1] =
{ STARPU_R, STARPU_R, ...};
struct starpu_codelet dummy_big_cl =
{
    .cuda_funcs = { dummy_big_kernel },
    .opencl_funcs = { dummy_big_kernel },
    .cpu_funcs = { dummy_big_kernel },
    .cpu_funcs_name = { "dummy_big_kernel" },
    .nbuffers = STARPU_NMAXBUFS+1,
    .dyn_modes = modes
};
task = starpu_task_create();
task->cl = &dummy_big_cl;
task->dyn_handles = malloc(task->cl->nbuffers * sizeof(starpu_data_handle_t));
for(i=0 ; i<task->cl->nbuffers ; i++)
    [ task->dyn_handles[i] = handle; ]
starpu_task_submit(task);
```

The whole code for this complex data interface is available in the directory `examples/basic_dynamic_handles.c`. 

Generated by Doxygen
6.6 Setting a Variable Number Of Data Handles For a Task

Normally, the number of data handles given to a task is fixed in the `starpu_codelet::nbuffers` codelet field. This field can however be set to `STARPU_VARIABLE_NBUFFERS`, in which case the `starpu_task::nbuffers` task field must be set, and the `starpu_task::modes` field (or `starpu_task::dyn_modes` field, see Setting Many Data Handles For a Task) should be used to specify the modes for the handles.

6.7 Using Multiple Implementations Of A Codelet

One may want to write multiple implementations of a codelet for a single type of device and let StarPU choose which one to run. As an example, we will show how to use SSE to scale a vector. The codelet can be written as follows:

```c
#include <xmmintrin.h>

void scal_sse_func(void *buffers[], void *cl_arg)
{
    float *vector = (float *) STARPU_VECTOR_GET_PTR(buffers[0]);
    unsigned int n = STARPU_VECTOR_GET_NX(buffers[0]);
    unsigned int n_iterations = n/4;
    if (n % 4 != 0)
        n_iterations++;
    __m128 *VECTOR = (__m128*) vector;
    __m128 factor __attribute__((aligned(16)));
    factor = _mm_set1_ps(*(float *) cl_arg);
    unsigned int i;
    for (i = 0; i < n_iterations; i++)
        VECTOR[i] = _mm_mul_ps(factor, VECTOR[i]);
}

struct starpu_codelet cl =
{
    .cpu_funcs = { scal_cpu_func, scal_sse_func },
    .cpu_funcs_name = { "scal_cpu_func", "scal_sse_func" },
    .nbuffers = 1,
    .modes = { STARPU_RW }
};
```

Schedulers which are multi-implementation aware (only `dmda` and `pheft` for now) will use the performance models of all the implementations it was given, and pick the one which seems to be the fastest.

6.8 Enabling Implementation According To Capabilities

Some implementations may not run on some devices. For instance, some CUDA devices do not support double floating point precision, and thus the kernel execution would just fail; or the device may not have enough shared memory for the implementation being used. The field `starpu_codelet::can_execute` permits to express this. For instance:

```c
static int can_execute(unsigned workerid, struct starpu_task *task, unsigned nimpl)
{
    const struct cudaDeviceProp *props;
    if (starpu_worker_get_type(workerid) == STARPU_CPU_WORKER)
        return 1;
    /* Cuda device */
    props = starpu_cuda_get_device_properties(workerid);
    if (props->major >= 2 || props->minor >= 3)
        /* At least compute capability 1.3, supports doubles */
        return 1;
    /* Old card, does not support doubles */
    return 0;
}

struct starpu_codelet cl =
{
    .can_execute = can_execute,
    .cpu_funcs = { cpu_func },
    .cpu_funcs_name = { "cpu_func" },
    .cuda_funcs = { gpu_func }
};
```

This can be essential e.g. when running on a machine which mixes various models of CUDA devices, to take benefit from the new models without crashing on old models.
Note: the function `starpu_codelet::can_execute` is called by the scheduler each time it tries to match a task with a worker, and should thus be very fast. The function `starpu_cuda_get_device_properties()` provides a quick access to CUDA properties of CUDA devices to achieve such efficiency.

Another example is to compile CUDA code for various compute capabilities, resulting with two CUDA functions, e.g. `scal_gpu_13` for compute capability 1.3, and `scal_gpu_20` for compute capability 2.0. Both functions can be provided to StarPU by using `starpu_codelet::cuda_funcs`, and `starpu_codelet::can_execute` can then be used to rule out the `scal_gpu_20` variant on a CUDA device which will not be able to execute it:

```c
static int can_execute(unsigned workerid, struct starpu_task *task, unsigned nimpl)
{
    const struct cudaDeviceProp *props;
    if (starpu_worker_get_type(workerid) == STARPU_CPU_WORKER)
        return 1;
    /* Cuda device */
    if (nimpl == 0)
        /* Trying to execute the 1.3 capability variant, we assume it is ok in all cases. */
        return 1;
    /* Trying to execute the 2.0 capability variant, check that the card can do it. */
    props = starpu_cuda_get_device_properties(workerid);
    if (props->major >= 2 || props->minor >= 0)
        /* At least compute capability 2.0, can run it */
        return 1;
    /* Old card, does not support 2.0, will not be able to execute the 2.0 variant. */
    return 0;
}
```

Another example is having specialized implementations for some given common sizes, for instance here we have a specialized implementation for 1024x1024 matrices:

```c
static int can_execute(unsigned workerid, struct starpu_task *task, unsigned nimpl)
{
    const struct cudaDeviceProp *props;
    if (starpu_worker_get_type(workerid) == STARPU_CPU_WORKER)
        return 1;
    /* Cuda device */
    switch (nimpl)
    {
        case 0:
            /* Trying to execute the generic capability variant. */
            return 1;
        case 1:
            /* Trying to execute the size == 1024 specific variant. */
            struct starpu_matrix_interface *interface = starpu_data_get_interface_on_node(task->handles[0]);
            return STARPU_MATRIX_GET_NX(interface) == 1024 && STARPU_MATRIX_GET_NY(interface) == 1024;
    }
}
```

Note: the most generic variant should be provided first, as some schedulers are not able to try the different variants.

6.9 Insert Task Utility

StarPU provides the wrapper function `starpu_task_insert()` to ease the creation and submission of tasks. Here the implementation of the codelet:
void func_cpu(void *descr[], void *args)
{
    int *x0 = (int *)STARPU_VARIABLE_GET_PTR(descr[0]);
    float *x1 = (float *)STARPU_VARIABLE_GET_PTR(descr[1]);
    int ifactor;
    float ffactor;
    starpu_codelet_unpack_args(args, &ifactor, &ffactor);
    *x0 = *x0 * ifactor;
    *x1 = *x1 * ffactor;
}

struct starpu_codelet mycodelet =
{
    .cpu_funcs = { func_cpu },
    .cpu_funcs_name = { "func_cpu" },
    .nbuffers = 2,
    .modes = { STARPU_RW, STARPU_RW }
};

And the call to the function starpu_task_insert():

starpu_task_insert(&mycodelet,
                   STARPU_VALUE, &ifactor, sizeof(ifactor),
                   STARPU_VALUE, &ffactor, sizeof(ffactor),
                   STARPU_RW, data_handles[0],
                   STARPU_RW, data_handles[1], 0);

The call to starpu_task_insert() is equivalent to the following code:

struct starpu_task *task = starpu_task_create();
task->cl = &mycodelet;
task->handles[0] = data_handles[0];
task->handles[1] = data_handles[1];
char *arg_buffer;
size_t arg_buffer_size;
starpu_codelet_pack_args(&arg_buffer, &arg_buffer_size,
                          STARPU_VALUE, &ifactor, sizeof(ifactor),
                          STARPU_VALUE, &ffactor, sizeof(ffactor),
                          0);
task->cl_arg = arg_buffer;
task->cl_arg_size = arg_buffer_size;
int ret = starpu_task_submit(task);

Here a similar call using STARPU_DATA_ARRAY.

starpu_task_insert(&mycodelet,
                   STARPU_DATA_ARRAY, data_handles, 2,
                   STARPU_VALUE, &ifactor, sizeof(ifactor),
                   STARPU_VALUE, &ffactor, sizeof(ffactor),
                   0);

If some part of the task insertion depends on the value of some computation, the macro STARPU_DATA_ACQUIRE_CB can be very convenient. For instance, assuming that the index variable i was registered as handle A_handle[i]:

/* Compute which portion we will work on, e.g. pivot */
starpu_task_insert(&which_index, STARPU_W, i_handle, 0);
/* And submit the corresponding task */
STARPU_DATA_ACQUIRE_CB(i_handle, STARPU_R,
                        starpu_task_insert(&work, STARPU_RW, A_handle[i], 0));

The macro STARPU_DATA_ACQUIRE_CB submits an asynchronous request for acquiring data i for the main application, and will execute the code given as third parameter when it is acquired. In other words, as soon as the value of i computed by the codelet which_index can be read, the portion of code passed as third parameter of STARPU_DATA_ACQUIRE_CB will be executed, and is allowed to read from i to use it e.g. as an index. Note that this macro is only available when compiling StarPU with the compiler gcc. There is several ways of calling the function starpu_codelet_unpack_args().

void func_cpu(void *descr[], void *args)
{
    int ifactor;
    float ffactor;
    starpu_codelet_unpack_args(args, &ifactor, &ffactor);
}
void func_cpu(void *descr[], void *args)
{
    int ifactor;
    float ffactor;
    starpu_codelet_unpack_args(_args, &ifactor, 0);
    starpu_codelet_unpack_args(_args, &ifactor, &ffactor);
}

void func_cpu(void *descr[], void *args)
{
    int ifactor;
    float ffactor;
    char buffer[100];
    starpu_codelet_unpack_args_and_copyleft(_args, buffer, 100, &ifactor, 0);
    starpu_codelet_unpack_args(buffer, &ffactor);
}

6.10 Getting Task Children

It may be interesting to get the list of tasks which depend on a given task, notably when using implicit dependencies, since this list is computed by StarPU. starpu_task_get_task_succs() provides it. For instance:

struct starpu_task *tasks[4];
ret = starpu_task_get_task_succs(task, sizeof(tasks)/sizeof(*tasks), tasks);

6.11 Parallel Tasks

StarPU can leverage existing parallel computation libraries by the means of parallel tasks. A parallel task is a task which gets worked on by a set of CPUs (called a parallel or combined worker) at the same time, by using an existing parallel CPU implementation of the computation to be achieved. This can also be useful to improve the load balance between slow CPUs and fast GPUs: since CPUs work collectively on a single task, the completion time of tasks on CPUs become comparable to the completion time on GPUs, thus relieving from granularity discrepancy concerns. hwloc support needs to be enabled to get good performance, otherwise StarPU will not know how to better group cores.

Two modes of execution exist to accomodate with existing usages.

6.11.1 Fork-mode Parallel Tasks

In the Fork mode, StarPU will call the codelet function on one of the CPUs of the combined worker. The codelet function can use starpu_combined_worker_get_size() to get the number of threads it is allowed to start to achieve the computation. The CPU binding mask for the whole set of CPUs is already enforced, so that threads created by the function will inherit the mask, and Thus execute where StarPU expected, the OS being in charge of choosing how to schedule threads on the corresponding CPUs. The application can also choose to bind threads by hand, using e.g. sched_getaffinity to know the CPU binding mask that StarPU chose.

For instance, using OpenMP (full source is available in examples/openmp/vector_scal.c):

void scal_cpu_func(void *buffers[], void *args)
{
    unsigned i;
    float *factor = _args;
    struct starpu_vector_interface *vector = buffers[0];
    unsigned n = STARPU_VECTOR_GET_N(vector);
    float *val = (float *)STARPU_VECTOR_GET_PTR(vector);
    #pragma omp parallel for num_threads(starpu_combined_worker_get_size())
    for (i = 0; i < n; i++)
        val[i] *= *factor;
}

static struct starpu_codelet cl =
{
    .modes = { STARPU_RW },
    .where = STARPU_CPU,
    .type = STARPU_FORKJOIN,
    .max_parallelism = INT_MAX,
    .cpu_funcs = {scal_cpu_func},
    .cpu_funcs_name = {"scal_cpu_func"},
    .nbuffers = 1,
};
Other examples include for instance calling a BLAS parallel CPU implementation (see examples/mult/xgemm.c).

### 6.11.2 SPMD-mode Parallel Tasks

In the SPMD mode, StarPU will call the codelet function on each CPU of the combined worker. The codelet function can use `starpu_combined_worker_get_size()` to get the total number of CPUs involved in the combined worker, and thus the number of calls that are made in parallel to the function, and `starpu_combined_worker_get_rank()` to get the rank of the current CPU within the combined worker. For instance:

```c
static void func(void *buffers[], void *args) {
    unsigned i;
    float *factor = (float *)args;
    struct starpu_vector_interface *vector = buffers[0];
    unsigned n = STARPU_VECTOR_GET_NX(vector);
    float *val = (float *)STARPU_VECTOR_GET_PTR(vector);

    /* Compute slice to compute */
    unsigned m = starpu_combined_worker_get_size();
    unsigned j = starpu_combined_worker_get_rank();
    unsigned slice = (n+m-1)/m;

    for (i = j * slice; i < (j+1) * slice && i < n; i++)
        val[i] *= *factor;
}
```

```c
static struct starpu_codelet cl = {
    .modes = { STARPU_RW },
    .type = STARPU_SPMD,
    .max_parallelism = INT_MAX,
    .cpu_funcs = { func },
    .cpu_funcs_name = { "func" },
    .nbuffers = 1,
};
```

Of course, this trivial example will not really benefit from parallel task execution, and was only meant to be simple to understand. The benefit comes when the computation to be done is so that threads have to e.g. exchange intermediate results, or write to the data in a complex but safe way in the same buffer.

### 6.11.3 Parallel Tasks Performance

To benefit from parallel tasks, a parallel-task-aware StarPU scheduler has to be used. When exposed to codelets with a flag `STARPU_FORKJOIN` or `STARPU_SPMD`, the schedulers `pheft` (parallel-heft) and `peager` (parallel eager) will indeed also try to execute tasks with several CPUs. It will automatically try the various available combined worker sizes (making several measurements for each worker size) and thus be able to avoid choosing a large combined worker if the codelet does not actually scale so much.

### 6.11.4 Combined Workers

By default, StarPU creates combined workers according to the architecture structure as detected by `hwloc`. It means that for each object of the `hwloc` topology (NUMA node, socket, cache, ...) a combined worker will be created. If some nodes of the hierarchy have a big arity (e.g. many cores in a socket without a hierarchy of shared caches), StarPU will create combined workers of intermediate sizes. The variable `STARPU_SYNTHESIZE_ARITY_COMBINED_WORKER` permits to tune the maximum arity between levels of combined workers. The combined workers actually produced can be seen in the output of the tool `starpu_machine_display` (the environment variable `STARPU_SCHED` has to be set to a combined worker-aware scheduler such as `pheft` or `peager`).

### 6.11.5 Concurrent Parallel Tasks

Unfortunately, many environments and libraries do not support concurrent calls. For instance, most OpenMP implementations (including the main ones) do not support concurrent `pragma omp parallel` statements without nesting them in another `pragma omp parallel` statement, but StarPU does not yet support creating its CPU workers by using such pragma. Other parallel libraries are also not safe when being invoked concurrently from different threads, due to the use of global variables in their sequential sections for instance.
The solution is then to use only one combined worker at a time. This can be done by setting the field `starpu_conf::single_combined_worker` to 1, or setting the environment variable `STARPU_SINGLE_COMBINED_WORKER` to 1. StarPU will then run only one parallel task at a time (but other CPU and GPU tasks are not affected and can be run concurrently). The parallel task scheduler will however still try varying combined worker sizes to look for the most efficient ones.

### 6.11.6 Synchronization Tasks

For the application convenience, it may be useful to define tasks which do not actually make any computation, but wear for instance dependencies between other tasks or tags, or to be submitted in callbacks, etc. The obvious way is of course to make kernel functions empty, but such task will thus have to wait for a worker to become ready, transfer data, etc.

A much lighter way to define a synchronization task is to set its `starpu_task::cl` field to `NULL`. The task will thus be a mere synchronization point, without any data access or execution content: as soon as its dependencies become available, it will terminate, call the callbacks, and release dependencies.

An intermediate solution is to define a codelet with its `starpu_codelet::where` field set to `STARPU_NOWHERE`, for instance:

```c
struct starpu_codelet cl =
{
    .where = STARPU_NOWHERE,
    .nbuffers = 1,
    .modes = { STARPU_R },
};
task = starpu_task_create();
task->cl = &cl;
task->handles[0] = handle;
starpu_task_submit(task);
```

will create a task which simply waits for the value of `handle` to be available for read. This task can then be depended on, etc.
Chapter 7

Data Management

TODO: intro qui parle de coherency entre autres

7.1 Data Interface

StarPU provides several data interfaces for programmers to describe the data layout of their application. There are predefined interfaces already available in StarPU. Users can define new data interfaces as explained in Defining A New Data Interface. All functions provided by StarPU are documented in Data Interfaces. You will find a short list below.

7.1.1 Variable Data Interface

A variable is a given size byte element, typically a scalar. Here an example of how to register a variable data to StarPU by using `starpu_variable_data_register()`.

```c
float var = 42.0;
starpu_data_handle_t var_handle;
starpu_variable_data_register(&var_handle, STARPU_MAIN_RAM, (uintptr_t)&var, sizeof(var));
```

7.1.2 Vector Data Interface

A vector is a fixed number of elements of a given size. Here an example of how to register a vector data to StarPU by using `starpu_vector_data_register()`.

```c
float vector[NX];
starpu_data_handle_t vector_handle;
starpu_vector_data_register(&vector_handle, STARPU_MAIN_RAM, (uintptr_t)vector, NX, sizeof(vector[0]));
```

7.1.3 Matrix Data Interface

To register 2-D matrices with a potential padding, one can use the matrix data interface. Here an example of how to register a matrix data to StarPU by using `starpu_matrix_data_register()`.

```c
float *matrix;
starpu_data_handle_t matrix_handle;
matrix = (float*)malloc(width * height * sizeof(float));
starpu_matrix_data_register(&matrix_handle, STARPU_MAIN_RAM, (uintptr_t)matrix, width, width, height, sizeof(float));
```

7.1.4 Block Data Interface

To register 3-D blocks with potential paddings on Y and Z dimensions, one can use the block data interface. Here an example of how to register a block data to StarPU by using `starpu_block_data_register()`.

```c
float *block;
starpu_data_handle_t block_handle;
block = (float*)malloc(nx*ny*nz*sizeof(float));
starpu_block_data_register(&block_handle, STARPU_MAIN_RAM, (uintptr_t)block, nx, nx*ny, nx, ny, nz, sizeof(float));
```
7.1.5 BCSR Data Interface

BCSR (Blocked Compressed Sparse Row Representation) sparse matrix data can be registered to StarPU using the bcsr data interface. Here an example on how to do so by using `starpu_bcsr_data_register()`.

```c
/*
  * We use the following matrix:
  * +----------------+
  * | 0 1 0 0 |
  * | 2 3 0 0 |
  * | 4 5 8 9 |
  * | 6 7 10 11 |
  * +----------------+
  *
  * nzval = [0, 1, 2, 3] ++ [4, 5, 6, 7] ++ [8, 9, 10, 11]
  * colind = [0, 0, 1]
  * rowptr = [0, 1, 3]
  * r = c = 2
  */

/* Size of the blocks */
int R = 2;
int C = 2;

int NROWS = 2;
int NNZ_BLOCKS = 3; /* out of 4 */
int NZVAL_SIZE = (R*C*NNZ_BLOCKS);

int nzval[NZVAL_SIZE] =
{ 0, 1, 2, 3, /* First block */
  4, 5, 6, 7, /* Second block */
  8, 9, 10, 11 /* Third block */};

uint32_t colind[NNZ_BLOCKS] =
{ 0, /* block-column index for first block in nzval */
  0, /* block-column index for second block in nzval */
  1 /* block-column index for third block in nzval */};

uint32_t rowptr[NROWS+1] =
{ 0, /* block-index in nzval of the first block of the first row. */
  1, /* block-index in nzval of the first block of the second row. */
  NNZ_BLOCKS /* number of blocks, to allow an easier element’s access for the kernels */};

starpu_data_handle_t bcsr_handle;
starpu_bcsr_data_register(&bcsr_handle,
    STARPU_MAIN_RAM,
    NNZ_BLOCKS,
    NROWS,
    (uintptr_t) nzval,
    colind,
    rowptr,
    0, /* firstentry */
    R,
    C,
    sizeof(nzval[0]));

StarPU provides an example on how to deal with such matrices in examples/spmv.

7.1.6 CSR Data Interface

TODO

7.2 Data Management

When the application allocates data, whenever possible it should use the `starpu_malloc()` function, which will ask CUDA or OpenCL to make the allocation itself and pin the corresponding allocated memory, or to use the `starpu←memory_pin()` function to pin memory allocated by other ways, such as local arrays. This is needed to permit asynchronous data transfer, i.e. permit data transfer to overlap with computations. Otherwise, the trace will show that the DriverCopyAsync state takes a lot of time, this is because CUDA or OpenCL then reverts to synchronous transfers.

By default, StarPU leaves replicates of data wherever they were used, in case they will be re-used by other tasks, thus saving the data transfer time. When some task modifies some data, all the other replicates are invalidated,
and only the processing unit which ran this task will have a valid replicate of the data. If the application knows that this data will not be re-used by further tasks, it should advise StarPU to immediately replicate it to a desired list of memory nodes (given through a bitmask). This can be understood like the write-through mode of CPU caches.

```c
starpu_data_set_wt_mask(img_handle, 1<<0);
```

will for instance request to always automatically transfer a replicate into the main memory (node 0), as bit 0 of the write-through bitmask is being set.

```c
starpu_data_set_wt_mask(img_handle, ~0U);
```

will request to always automatically broadcast the updated data to all memory nodes. Setting the write-through mask to ~0U can also be useful to make sure all memory nodes always have a copy of the data, so that it is never evicted when memory gets scarce.

Implicit data dependency computation can become expensive if a lot of tasks access the same piece of data. If no dependency is required on some piece of data (e.g. because it is only accessed in read-only mode, or because write accesses are actually commutative), use the function `starpu_data_set_sequential_consistency_flag()` to disable implicit dependencies on this data.

In the same vein, accumulation of results in the same data can become a bottleneck. The use of the mode `STARPU_REDUX` permits to optimize such accumulation (see Data Reduction). To a lesser extent, the use of the flag `STARPU_COMMUTE` keeps the bottleneck (see Commute Data Access), but at least permits the accumulation to happen in any order.

Applications often need a data just for temporary results. In such a case, registration can be made without an initial value, for instance this produces a vector data:

```c
starpu_vector_data_register(handle, -1, 0, n, sizeof(float));
```

StarPU will then allocate the actual buffer only when it is actually needed, e.g. directly on the GPU without allocating in main memory.

In the same vein, once the temporary results are not useful any more, the data should be thrown away. If the handle is not to be reused, it can be unregistered:

```c
starpu_data_unregister_submit(handle);
```

actual unregistration will be done after all tasks working on the handle terminate.

If the handle is to be reused, instead of unregistering it, it can simply be invalidated:

```c
starpu_data_invalidate_submit(handle);
```

the buffers containing the current value will then be freed, and reallocated only when another task writes some value to the handle.

### 7.3 Data Prefetch

The scheduling policies `heft`, `dmda` and `pheap` perform data prefetch (see `STARPU_PREFETCH`): as soon as a scheduling decision is taken for a task, requests are issued to transfer its required data to the target processing unit, if needed, so that when the processing unit actually starts the task, its data will hopefully be already available and it will not have to wait for the transfer to finish.

The application may want to perform some manual prefetching, for several reasons such as excluding initial data transfers from performance measurements, or setting up an initial statically-computed data distribution on the machine before submitting tasks, which will thus guide StarPU toward an initial task distribution (since StarPU will try to avoid further transfers).

This can be achieved by giving the function `starpu_data_prefetch_on_node()` the handle and the desired target memory node. The `starpu_data_idle_prefetch_on_node()` variant can be used to issue the transfer only when the bus is idle.

Conversely, one can advise StarPU that some data will not be useful in the close future by calling `starpu_data <-- wont_use()`. StarPU will then write its value back to its home node, and evict it from GPUs when room is needed.

### 7.4 Partitioning Data

An existing piece of data can be partitioned in sub parts to be used by different tasks, for instance:
# Data Management

```c
#define NX 1048576
#define PARTS 16
int vector[NX];
starpu_data_handle_t handle;
/* Declare data to StarPU */
starpu_vector_data_register(&handle, STARPU_MAIN_RAM, (uintptr_t)
vector, NX, sizeof(vector[0]));
/* Partition the vector in PARTS sub-vectors */
struct starpu_data_filter f = {
    .filter_func = starpu_vector_filter_block,
    .nchildren = PARTS
};
starpu_data_partition(handle, &f);
```

The task submission then uses the function `starpu_data_get_sub_data()` to retrieve the sub-handles to be passed as tasks parameters.

```c
/* Submit a task on each sub-vector */
for (i=0; i<starpu_data_get_nb_children(handle); i++)
    {
        /* Get subdata number i (there is only 1 dimension) */
        starpu_data_handle_t sub_handle = starpu_data_get_sub_data(
        handle, 1, i);
        struct starpu_task *task = starpu_task_create();
        task->handles[0] = sub_handle;
        task->cl = &cl;
        task->synchronous = 1;
        task->cl_arg = &factor;
        task->cl_arg_size = sizeof(factor);
        starpu_task_submit(task);
    }
```

Partitioning can be applied several times, see `examples/basic_examples/mult.c` and `examples/filters/`. Wherever the whole piece of data is already available, the partitioning will be done in-place, i.e. without allocating new buffers but just using pointers inside the existing copy. This is particularly important to be aware of when using OpenCL, where the kernel parameters are not pointers, but cl_mem handles. The kernel thus needs to be also passed the offset within the OpenCL buffer:

```c
void opencl_func(void *buffers[], void *cl_arg)
{
    cl_mem vector = (cl_mem) STARPU_VECTOR_GET_DEV_HANDLE(buffers[0]);
    unsigned offset = STARPU_BLOCK_GET_OFFSET(buffers[0]);
    ...
    clSetKernelArg(kernel, 0, sizeof(vector), &vector);
    clSetKernelArg(kernel, 1, sizeof(offset), &offset);
    ...
}
```

And the kernel has to shift from the pointer passed by the OpenCL driver:

```c
__kernel void opencl_kernel(__global int *vector, unsigned offset)
{
    block = (__global void *)block + offset;
    ...
}
```

StarPU provides various interfaces and filters for matrices, vectors, etc., but applications can also write their own data interfaces and filters, see `examples/interface` and `examples/filters/custom_mf` for an example, and see Defining A New Data Interface and Defining A New Data Filter for documentation.

### 7.5 Asynchronous Partitioning

The partitioning functions described in the previous section are synchronous: `starpu_data_partition()` and `starpu_data_unpartition()` both wait for all the tasks currently working on the data. This can be a bottleneck for the application.

An asynchronous API also exists, it works only on handles with sequential consistency. The principle is to first plan the partitioning, which returns data handles of the partition, which are not functional yet. When submitting tasks, one can mix using the handles of the partition, of the whole data. One can even partition recursively and mix using handles at different levels of the recursion. Of course, StarPU will have to introduce coherency synchronization.
fmultiple_submit_implicit is a complete example using this technique. One can also look at fmultiple_submit_readonly which contains the explicit coherency synchronization which are automatically introduced by StarPU for fmultiple_submit_implicit.

In short, we first register a matrix and plan the partitioning:

```c
starpu_matrix_data_register(handle, STARPU_MAIN_RAM, (uintptr_t) matrix, NX, NX, NY, sizeof(matrix[0]));
struct starpu_data_filter f_vert = {
    .filter_func = starpu_matrix_filter_block,
    .nchildren = PARTS
};
starpu_data_partition_plan(handle, &f_vert, vert_handle);
```

`starpu_data_partition_plan()` returns the handles for the partition in `vert_handle`.

One can then submit tasks working on the main handle, and tasks working on `vert_handle` handles. Between using the main handle and `vert_handle` handles, StarPU will automatically call `starpu_data_partition_submit` and `starpu_data_unpartition_submit`.

All this code is asynchronous, just submitting which tasks, partitioning and unpartitioning will be done at runtime. Planning several partitioning of the same data is also possible, StarPU will unpartition and repartition as needed when mixing accesses of different partitions. If data access is done in read-only mode, StarPU will allow the different partitioning to coexist. As soon as a data is accessed in read-write mode, StarPU will automatically unpartition everything and activate only the partitioning leading to the data being written to.

For instance, for a stencil application, one can split a subdomain into its interior and halos, and then just submit a task updating the whole subdomain, then submit MPI sends/receives to update the halos, then submit again a task updating the whole subdomain, etc. and StarPU will automatically partition/unpartition each time.

### 7.6 Manual Partitioning

One can also handle partitioning by hand, by registering several views on the same piece of data. The idea is then to manage the coherency of the various views through the common buffer in the main memory. `fmultiple←manual` is a complete example using this technique.

In short, we first register the same matrix several times:

```c
starpu_matrix_data_register(handle, STARPU_MAIN_RAM, (uintptr_t) matrix, NX, NX, NY, sizeof(matrix[0]));
for (i = 0; i < PARTS; i++)
    starpu_matrix_data_register(&vert_handle[i], STARPU_MAIN_RAM , (uintptr_t)&matrix[0][i*(NX/PARTS)], NX, NX/PARTS, NY, sizeof(matrix[0][0]));
```

Since StarPU is not aware that the two handles are actually pointing to the same data, we have a danger of inadvertently submitting tasks to both views, which will bring a mess since StarPU will not guarantee any coherency between the two views. To make sure we don’t do this, we invalidate the view that we will not use:

```c
for (i = 0; i < PARTS; i++)
    starpu_data_invalidate(vert_handle[i]);
```

Then we can safely work on `handle`.

When we want to switch to the vertical slice view, all we need to do is bring coherency between them by running an empty task on the home node of the data:

```c
void empty(void *buffers[], void *cl_arg)
{
}
struct starpu_codelet cl_switch =
{
    .cpu_funcs = {empty},
    .nbuffers = STARPU_VARIABLE_NBUFFERS,
};
ret = starpu_task_insert(&cl_switch, STARPU_RW, handle, STARPU_W, vert_handle[0], STARPU_W, vert_handle[1], 0);
```

The execution of the `switch` task will get back the matrix data into the main memory, and thus the vertical slices will get the updated value there.

Again, we prefer to make sure that we don’t accidentally access the matrix through the whole-matrix handle:

```c
starpu_data_invalidate_submit(handle);
```

And now we can start using vertical slices, etc.
7.7 Defining A New Data Filter

StarPU provides a series of predefined filters in API_Data_Partition, but additional filters can be defined by the application. The principle is that the filter function just fills the memory location of the i-th subpart of a data. Examples are provided in src/datawizard/interfaces/*_filters.c, and see starpu_data_filter::filter_func for the details.

7.8 Data Reduction

In various cases, some piece of data is used to accumulate intermediate results. For instances, the dot product of a vector, maximum/minimum finding, the histogram of a photograph, etc. When these results are produced along the whole machine, it would not be efficient to accumulate them in only one place, incurring data transmission each and access concurrency.

StarPU provides a mode STARPU_REDUX, which permits to optimize this case: it will allocate a buffer on each memory node, and accumulate intermediate results there. When the data is eventually accessed in the normal mode STARPU_R, StarPU will collect the intermediate results in just one buffer.

For this to work, the user has to use the function starpu_data_set_reduction_methods() to declare how to initialize these buffers, and how to assemble partial results.

For instance, cg uses that to optimize its dot product: it first defines the codelets for initialization and reduction:

```c
struct starpu_codelet bzero_variable_cl = {
    .cpu_funcs = { bzero_variable_cpu },
    .cpu_funcs_name = { "bzero_variable_cpu" },
    .cuda_funcs = { bzero_variable_cuda },
    .nbuffers = 1,
};

static void accumulate_variable_cpu(void *descr[], void *cl_arg) {
    double *v_dst = (double *)STARPU_VARIABLE_GET_PTR(descr[0]);
    double *v_src = (double *)STARPU_VARIABLE_GET_PTR(descr[1]);
    *v_dst = *v_dst + *v_src;
}

static void accumulate_variable_cuda(void *descr[], void *cl_arg) {
    double *v_dst = (double *)STARPU_VARIABLE_GET_PTR(descr[0]);
    double *v_src = (double *)STARPU_VARIABLE_GET_PTR(descr[1]);
    cublasaxpy(1, (double)1.0, v_src, 1, v_dst, 1);
    cudaStreamSynchronize(starpu_cuda_get_local_stream());
}

struct starpu_codelet accumulate_variable_cl = {
    .cpu_funcs = { accumulate_variable_cpu },
    .cpu_funcs_name = { "accumulate_variable_cpu" },
    .cuda_funcs = { accumulate_variable_cuda },
    .nbuffers = 1,
};

and attaches them as reduction methods for its handle dtq:

starpu_variable_data_register(&dtq_handle, -1, NULL, sizeof(type));
starpu_data_set_reduction_methods(dtq_handle, &accumulate_variable_cl, &bzero_variable_cl);

and dtq_handle can now be used in mode STARPU_REDUX for the dot products with partitioned vectors:

```
7.9 Commute Data Access

The example `cg` also uses reduction for the blocked gemv kernel, leading to yet more relaxed dependencies and more parallelism. `STARPU_REDUX` can also be passed to `starpu_mpi_task_insert()` in the MPI case. This will however not produce any MPI communication, but just pass `STARPU_REDUX` to the underlying `starpu_task_insert()`. It is up to the application to call `starpu_mpi_redux_data()`, which posts tasks which will reduce the partial results among MPI nodes into the MPI node which owns the data. For instance, some hypothetical application which collects partial results into data `res`, then uses it for other computation, before looping again with a new reduction:

```c
for (i = 0; i < 100; i++)
{
    starpu_mpi_task_insert(MPI_COMM_WORLD, &init_res, STARPU_W, res, 0);
    starpu_mpi_task_insert(MPI_COMM_WORLD, &work, STARPU_RW, A, STARPU_R, B,
        STARPU_REDUX, res, 0);
    starpu_mpi_redux_data(MPI_COMM_WORLD, res);
    starpu_mpi_task_insert(MPI_COMM_WORLD, &work2, STARPU_RW, B, STARPU_R,
        res, 0);
}
```

7.9 Commute Data Access

By default, the implicit dependencies computed from data access use the sequential semantic. Notably, write accesses are always serialized in the order of submission. In some applicative cases, the write contributions can actually be performed in any order without affecting the eventual result. In this case it is useful to drop the strictly sequential semantic, to improve parallelism by allowing StarPU to reorder the write accesses. This can be done by using the `STARPU_COMMUTE` data access flag. Accesses without this flag will however properly be serialized against accesses with this flag. For instance:

```c
starpu_task_insert(&cl1, STARPU_R, h, STARPU_RW, handle, 0);
starpu_task_insert(&cl2, STARPU_R, handle1, STARPU_RW|STARPU_COMMUTE
    , handle, 0);
starpu_task_insert(&cl2, STARPU_R, handle2, STARPU_RW|STARPU_COMMUTE
    , handle, 0);
starpu_task_insert(&cl3, STARPU_R, g, STARPU_RW, handle, 0);
```

The two tasks running `cl2` will be able to commute: depending on whether the value of `handle1` or `handle2` becomes available first, the corresponding task running `cl2` will start first. The task running `cl1` will however always be run before them, and the task running `cl3` will always be run after them.

If a lot of tasks use the commute access on the same set of data and a lot of them are ready at the same time, it may become interesting to use an arbiter, see Concurrent Data Accesses.

7.10 Concurrent Data Accesses

When several tasks are ready and will work on several data, StarPU is faced with the classical Dining Philosophers problem, and has to determine the order in which it will run the tasks. Data accesses usually use sequential ordering, so data accesses are usually already serialized, and thus by default StarPU uses the Dijkstra solution which scales very well in terms of overhead: tasks will just acquire data one by one by data handle pointer value order. When sequential ordering is disabled or the `STARPU_COMMUTE` flag is used, there may be a lot of concurrent accesses to the same data, and the Dijkstra solution gets only poor parallelism, typically in some pathological cases which do happen in various applications. In this case, one can use a data access arbiter, which implements the classical centralized solution for the Dining Philosophers problem. This is more expensive in terms of overhead since it is centralized, but it opportunistically gets a lot of parallelism. The centralization can also be avoided by using several arbiters, thus separating sets of data for which arbitration will be done. If a task accesses data from different arbiters, it will acquire them arbiter by arbiter, in arbiter pointer value order.

See the `tests/datawizard/test_arbiter.cpp` example. Arbiter however do not support the `STARPU_REDUX` flag yet.

7.11 Temporary Buffers

There are two kinds of temporary buffers: temporary data which just pass results from a task to another, and scratch data which are needed only internally by tasks.

Generated by Doxygen
7.11.1 Temporary Data

Data can sometimes be entirely produced by a task, and entirely consumed by another task, without the need for other parts of the application to access it. In such case, registration can be done without prior allocation, by using the special memory node number \(-1\), and passing a zero pointer. StarPU will actually allocate memory only when the task creating the content gets scheduled, and destroy it on unregistration.

In addition to this, it can be tedious for the application to have to unregister the data, since it will not use its content anyway. The unregistration can be done lazily by using the function `starpu_data_unregister_submit()`, which will record that no more tasks accessing the handle will be submitted, so that it can be freed as soon as the last task accessing it is over.

The following code examplifies both points: it registers the temporary data, submits three tasks accessing it, and records the data for automatic unregistration.

```c
starpu_vector_data_register(&handle, -1, 0, n, sizeof(float));
starpu_task_insert(&produce_data, STARPU_W, handle, 0);
starpu_task_insert(&compute_data, STARPU_RW, handle, 0);
starpu_task_insert(&summarize_data, STARPU_RW, handle, STARPU_W,
                    result_handle, 0);
starpu_data_unregister_submit(handle);
```

The application may also want to see the temporary data initialized on the fly before being used by the task. This can be done by using `starpu_data_set_reduction_methods()` to set an initialization codelet (no redux codelet is needed).

7.11.2 Scratch Data

Some kernels sometimes need temporary data to achieve the computations, i.e. a workspace. The application could allocate it at the start of the codelet function, and free it at the end, but this would be costly. It could also allocate one buffer per worker (similarly to How To Initialize A Computation Library Once For Each Worker?), but this would make them systematic and permanent. A more optimized way is to use the data access mode `STARPU_SCRATCH`, as examplified below, which provides per-worker buffers without content consistency. The buffer is registered only once, using memory node \(-1\), i.e. the application didn’t allocate memory for it, and StarPU will allocate it on demand at task execution.

```c
starpu_vector_data_register(&workspace, -1, 0, sizeof(float));
for (i = 0; i < N; i++)
  starpu_task_insert(&compute, STARPU_R, input[i], STARPU_SCRATCH,
                    workspace, STARPU_W, output[i], 0);
```

StarPU will make sure that the buffer is allocated before executing the task, and make this allocation per-worker: for CPU workers, notably, each worker has its own buffer. This means that each task submitted above will actually have its own workspace, which will actually be the same for all tasks running one after the other on the same worker. Also, if for instance memory becomes scarce, StarPU will notice that it can free such buffers easily, since the content does not matter.

The example `examples/pi` uses scratches for some temporary buffer.

7.12 The Multiformat Interface

It may be interesting to represent the same piece of data using two different data structures: one only used on CPUs, and one only used on GPUs. This can be done by using the multiformat interface. StarPU will be able to convert data from one data structure to the other when needed. Note that the scheduler `dmda` is the only one optimized for this interface. The user must provide StarPU with conversion codelets:

```c
#define NX 1024
struct point array_of_structs[NX];
starpu_data_handle_t handle;

/*
 * The conversion of a piece of data is itself a task, though it is created,
 * submitted and destroyed by StarPU internals and not by the user. Therefore,
 * we have to define two codelets.
 * Note that for now the conversion from the CPU format to the GPU format has to
 * be executed on the GPU, and the conversion from the GPU to the CPU has to be
 * executed on the CPU.
 */
#ifdef STARPU_USE_OPENCL
void cpu_to_opencl_opencl_func(void *buffers[], void *args);
starpu_codelet cpu_to_opencl_cl =
*/
```
## 7.13 Defining A New Data Interface

Let's define a new data interface to manage complex numbers.

```c
/* interface for complex numbers */
struct starpu_complex_interface
{
    double *real;
    double *imaginary;
    int nx;
};
```

Registering such a data to StarPU is easily done using the function `starpu_data_register()`. The last parameter of the function, `interface_complex_ops`, will be described below.

```c
void starpu_complex_data_register(starpu_data_handle_t *handle,
    unsigned home_node, double *real, double *imaginary, int nx)
{
    struct starpu_complex_interface complex =
```

Kernels can be written almost as for any other interface. Note that `STARPU_MULTIFORMAT_GET_CPU_PTR` shall only be used for CPU kernels. CUDA kernels must use `STARPU_MULTIFORMAT_GET_CUDA_PTR`, and OpenCL kernels must use `STARPU_MULTIFORMAT_GET_OPENCL_PTR`. `STARPU_MULTIFORMAT_GET_NX` may be used in any kind of kernel.

```c
static void
multiformat_scal_cpu_func(void *buffers[], void *args)
{
    struct point *aos;
    unsigned int n;
    aos = STARPU_MULTIFORMAT_GET_CPU_PTR(buffers[0]);
    n = STARPU_MULTIFORMAT_GET_NX(buffers[0]);
    ...
}
```

```c
extern "C" void multiformat_scal_cuda_func(void *buffers[], void *args)
{
    unsigned int n;
    struct struct_of_arrays *soa;
    soa = (struct struct_of_arrays *) STARPU_MULTIFORMAT_GET_CUDA_PTR(buffers[0]);
    n = STARPU_MULTIFORMAT_GET_NX(buffers[0]);
    ...
}
```

A full example may be found in `examples/basic_examples/multiformat.c`.

### 7.13 Defining A New Data Interface

Let's define a new data interface to manage complex numbers.

```c
/* interface for complex numbers */
struct starpu_complex_interface
{
    double *real;
    double *imaginary;
    int nx;
};
```

Registering such a data to StarPU is easily done using the function `starpu_data_register()`. The last parameter of the function, `interface_complex_ops`, will be described below.

```c
void starpu_complex_data_register(starpu_data_handle_t *handle,
    unsigned home_node, double *real, double *imaginary, int nx)
{
    struct starpu_complex_interface complex =
```

Kernels can be written almost as for any other interface. Note that `STARPU_MULTIFORMAT_GET_CPU_PTR` shall only be used for CPU kernels. CUDA kernels must use `STARPU_MULTIFORMAT_GET_CUDA_PTR`, and OpenCL kernels must use `STARPU_MULTIFORMAT_GET_OPENCL_PTR`. `STARPU_MULTIFORMAT_GET_NX` may be used in any kind of kernel.

```c
static void
multiformat_scal_cpu_func(void *buffers[], void *args)
{
    struct point *aos;
    unsigned int n;
    aos = STARPU_MULTIFORMAT_GET_CPU_PTR(buffers[0]);
    n = STARPU_MULTIFORMAT_GET_NX(buffers[0]);
    ...
}
```

```c
extern "C" void multiformat_scal_cuda_func(void *buffers[], void *args)
{
    unsigned int n;
    struct struct_of_arrays *soa;
    soa = (struct struct_of_arrays *) STARPU_MULTIFORMAT_GET_CUDA_PTR(buffers[0]);
    n = STARPU_MULTIFORMAT_GET_NX(buffers[0]);
    ...
}
```

A full example may be found in `examples/basic_examples/multiformat.c`.

### 7.13 Defining A New Data Interface

Let's define a new data interface to manage complex numbers.

```c
/* interface for complex numbers */
struct starpu_complex_interface
{
    double *real;
    double *imaginary;
    int nx;
};
```

Registering such a data to StarPU is easily done using the function `starpu_data_register()`. The last parameter of the function, `interface_complex_ops`, will be described below.

```c
void starpu_complex_data_register(starpu_data_handle_t *handle,
    unsigned home_node, double *real, double *imaginary, int nx)
{
    struct starpu_complex_interface complex =
```
Different operations need to be defined for a data interface through the type `starpu_data_interface_ops`. We only define here the basic operations needed to run simple applications. The source code for the different functions can be found in the file `examples/interface/complex_interface.c`, the details of the hooks to be provided are documented `starpu_data_interface_ops`.

```c
static struct starpu_data_interface_ops interface_complex_ops =
{
    .register_data_handle = complex_register_data_handle,
    .allocate_data_on_node = complex_allocate_data_on_node,
    .copy_methods = &complex_copy_methods,
    .get_size = complex_get_size,
    .footprint = complex_footprint,
    .interfaceid = STARPU_UNKNOWN_INTERFACE_ID,
    .interface_size = sizeof(struct starpu_complex_interface),
};
```

Functions need to be defined to access the different fields of the complex interface from a StarPU data handle.

```c
double *starpu_complex_get_real(starpu_data_handle_t handle)
{
    struct starpu_complex_interface *complex_interface =
        (struct starpu_complex_interface *) starpu_data_get_interface_on_node
            (handle, STARPU_MAIN_RAM);
    return complex_interface->real;
}
```

```c
double *starpu_complex_get_imaginary(starpu_data_handle_t handle);
double *starpu_complex_get_nx(starpu_data_handle_t handle);
```

Similar functions need to be defined to access the different fields of the complex interface from a `void *` pointer to be used within codelet implementations.

```c
#define STARPU_COMPLEX_GET_REAL(interface) (((struct starpu_complex_interface *)(interface))->real)
#define STARPU_COMPLEX_GET_IMAGINARY(interface) (((struct starpu_complex_interface *
    (interface))->imaginary)
#define STARPU_COMPLEX_GET_NX(interface) (((struct starpu_complex_interface *
    (interface))->nx)
```

Complex data interfaces can then be registered to StarPU.

```c
double real = 45.0;
double imaginary = 12.0;
starpu_complex_data_register(&handle1, STARPU_MAIN_RAM, &real, &imaginary, 1);
starpu_task_insert(&cl_display, STARPU_R, handle1, 0);
```

and used by codelets.

```c
void display_complex_codelet(void *descr[], void *args)
{
    int nx = STARPU_COMPLEX_GET_NX(descr[0]);
    double *real = STARPU_COMPLEX_GET_REAL(descr[0]);
    double *imaginary = STARPU_COMPLEX_GET_IMAGINARY(descr[0]);
    int i;
    for(i=0 ; i<nx ; i++)
    {
        fprintf(stderr, "Complex[%d] = %3.2f + %3.2f i
", i, real[i], imaginary[i]);
    }
}
```

The whole code for this complex data interface is available in the directory `examples/interface/`. 
7.14 Specifying A Target Node For Task Data

When executing a task on a GPU for instance, StarPU would normally copy all the needed data for the tasks on the embedded memory of the GPU. It may however happen that the task kernel would rather have some of the datas kept in the main memory instead of copied in the GPU, a pivoting vector for instance. This can be achieved by setting the `starpu_codelet::specific_nodes` flag to 1, and then fill the `starpu_codelet::nodes` array (or `starpu_codelet::dyn_nodes` when `starpu_codelet::nbuffers` is greater than `STARPU_NMAXBUFS`) with the node numbers where data should be copied to, or `STARPU_SPECIFIC_NODE_LOCAL` to let StarPU copy it to the memory node where the task will be executed.

`STARPU_SPECIFIC_NODE_CPU` can also be used to request data to be put in CPU-accessible memory (and let StarPU choose the NUMA node). `STARPU_SPECIFIC_NODE_FAST` and `STARPU_SPECIFIC_NODE_SLOW` can also be used.

For instance, with the following codelet:

```c
struct starpu_codelet cl =
{
    .cuda_funcs = { kernel },
    .nbuffers = 2,
    .modes = {STARPU_RW, STARPU_RW},
    .specific_nodes = 1,
    .nodes = {STARPU_SPECIFIC_NODE_CPU, STARPU_SPECIFIC_NODE_LOCAL},
};
```

the first data of the task will be kept in the CPU memory, while the second data will be copied to the CUDA GPU as usual. A working example is available in `tests/datawizard/specific_node.c`

With the following codelet:

```c
struct starpu_codelet cl =
{
    .cuda_funcs = { kernel },
    .nbuffers = 2,
    .modes = {STARPU_RW, STARPU_RW},
    .specific_nodes = 1,
    .nodes = {STARPU_SPECIFIC_NODE_LOCAL, STARPU_SPECIFIC_NODE_SLOW},
};
```

The first data will be copied into fast (but probably size-limited) local memory while the second data will be left in slow (but large) memory. This makes sense when the kernel does not make so many accesses to the second data, and thus data being remote e.g. over a PCI bus is not a performance problem, and avoids filling the fast local memory with data which does not need the performance.
Chapter 8

Scheduling

8.1 Task Scheduling Policies

The basics of the scheduling policy are the following:

- The scheduler gets to schedule tasks (push operation) when they become ready to be executed, i.e. they are not waiting for some tags, data dependencies or task dependencies.
- Workers pull tasks (pop operation) one by one from the scheduler.

This means scheduling policies usually contain at least one queue of tasks to store them between the time when they become available, and the time when a worker gets to grab them.

By default, StarPU uses the work-stealing scheduler lws. This is because it provides correct load balance and locality even if the application codelets do not have performance models. Other non-modelling scheduling policies can be selected among the list below, thanks to the environment variable STARPU_SCHED. For instance export STARPU_SCHED=dmda. Use help to get the list of available schedulers.

Non Performance Modelling Policies:
- The eager scheduler uses a central task queue, from which all workers draw tasks to work on concurrently. This however does not permit to prefetch data since the scheduling decision is taken late. If a task has a non-0 priority, it is put at the front of the queue.
- The random scheduler uses a queue per worker, and distributes tasks randomly according to assumed worker overall performance.
- The ws (work stealing) scheduler uses a queue per worker, and schedules a task on the worker which released it by default. When a worker becomes idle, it steals a task from the most loaded worker.
- The lws (locality work stealing) scheduler uses a queue per worker, and schedules a task on the worker which released it by default. When a worker becomes idle, it steals a task from neighbour workers. It also takes into account priorities.
- The prio scheduler also uses a central task queue, but sorts tasks by priority specified by the programmer (between -5 and 5).

8.2 Performance Model-Based Task Scheduling Policies

If (and only if) your application codelets have performance models (Performance Model Example), you should change the scheduler thanks to the environment variable STARPU_SCHED, to select one of the policies below, in order to take advantage of StarPU's performance modelling. For instance export STARPU_SCHED=dmda. Use help to get the list of available schedulers.

Note: Depending on the performance model type chosen, some preliminary calibration runs may be needed for the model to converge. If the calibration has not been done, or is insufficient yet, or if no performance model is specified for a codelet, every task built from this codelet will be scheduled using an eager fallback policy.

Troubleshooting: Configuring and recompiling StarPU using the -enable-verbose configure flag displays some statistics at the end of execution about the percentage of tasks which have been scheduled by a DM* family policy using performance model hints. A low or zero percentage may be the sign that performance models are not converging or that codelets do not have performance models enabled.

Performance Modelling Policies:
The dm (deque model) scheduler takes task execution performance models into account to perform a HEFT-similar scheduling strategy: it schedules tasks where their termination time will be minimal. The difference with HEFT is that dm schedules tasks as soon as they become available, and thus in the order they become available, without taking priorities into account.

The dmda (deque model data aware) scheduler is similar to dm, but it also takes into account data transfer time. The dmddar (deque model data aware ready) scheduler is similar to dmda, but it also privileges tasks whose data buffers are already available on the target device.

The dmddas (deque model data aware sorted) scheduler is similar to dmdar, except that it sorts tasks by priority order, which allows to become even closer to HEFT by respecting priorities after having made the scheduling decision (but it still schedules tasks in the order they become available).

The dmddasdsd (deque model data aware sorted decision) scheduler is similar to dmddas, except that when scheduling a task, it takes into account its priority when computing the minimum completion time, since this task may get executed before others, and thus the latter should be ignored.

The heft (heterogeneous earliest finish time) scheduler is a deprecated alias for dmda.

The pheft (parallel HEFT) scheduler is similar to dmda, it also supports parallel tasks (still experimental). Should not be used when several contexts using it are being executed simultaneously.

The peager (parallel eager) scheduler is similar to eager, it also supports parallel tasks (still experimental). Should not be used when several contexts using it are being executed simultaneously.

8.3 Task Distribution Vs Data Transfer

Distributing tasks to balance the load induces data transfer penalty. StarPU thus needs to find a balance between both. The target function that the scheduler dmda of StarPU tries to minimize is alpha * T_execution + beta * T_data_transfer, where T_execution is the estimated execution time of the codelet (usually accurate), and T_data_transfer is the estimated data transfer time. The latter is estimated based on bus calibration before execution start, i.e. with an idle machine, thus without contention. You can force bus re-calibration by running the tool starpu_calibrate_bus. The beta parameter defaults to 1, but it can be worth trying to tweak it by using export STARPU_SCHED_BETA=2 (STARPU_SCHED_BETA) for instance, since during real application execution, contention makes transfer times bigger. This is of course imprecise, but in practice, a rough estimation already gives the good results that a precise estimation would give.

8.4 Energy-based Scheduling

If the application can provide some energy consumption performance model (through the field starpu_codelet::<energy_model>), StarPU will take it into account when distributing tasks. The target function that the scheduler dmda minimizes becomes alpha * T_execution + beta * T_data_transfer + gamma * Consumption, where Consumption is the estimated task consumption in Joules. To tune this parameter, use export STARPU_SCHED_GAMMA=3000 (STARPU_SCHED_GAMMA) for instance, to express that each Joule (i.e kW during 1000us) is worth 3000us execution time penalty. Setting alpha and beta to zero permits to only take into account energy consumption.

This is however not sufficient to correctly optimize energy: the scheduler would simply tend to run all computations on the most energy-conservative processing unit. To account for the consumption of the whole machine (including idle processing units), the idle power of the machine should be given by setting export STARPU_IDLE_POWER=200 (STARPU_IDLE_POWER) for 200W, for instance. This value can often be obtained from the machine power supplier.

The energy actually consumed by the total execution can be displayed by setting export STARPU_PROFILEING=1 STARPU_WORKER_STATS=1.

On-line task consumption measurement is currently only supported through the CL_PROFILING_POWER_CONSUMED OpenCL extension, implemented in the Movisim simulator. Applications can however provide explicit measurements by using the function starpu_perfmodel_update_history() (exemplified in Performance Model Example with the energy_model performance model). Fine-grain measurement is often not feasible with the feedback provided by the hardware, so the user can for instance run a given task a thousand times, measure the global consumption for that series of tasks, divide it by a thousand, repeat for varying kinds of tasks and task sizes, and eventually feed StarPU with these manual measurements through starpu_perfmodel_update_history(). For instance, for CUDA devices, nvidia-smi -q -d POWER can be used to get the current consumption in Watt. Multiplying this value by the average duration of a single task gives the consumption of the task in Joules, which
can be given to `starpu_permodel_update_history()`.

## 8.5 Static Scheduling

In some cases, one may want to force some scheduling, for instance force a given set of tasks to GPU0, another set to GPU1, etc. while letting some other tasks be scheduled on any other device. This can indeed be useful to guide StarPU into some work distribution, while still letting some degree of dynamism. For instance, to force execution of a task on CUDA0:

```c
task->execute_on_a_specific_worker = 1;
task->workerid = starpu_worker_get_by_type(STARPU_CUDA_WORKER, 0);
```

One can also specify a set worker(s) which are allowed to take the task, as an array of bit, for instance to allow workers 2 and 42:

```c
task->workerids = calloc(2, sizeof(uint32_t));
task->workerids[2/32] |= (1 << (2%32));
task->workerids[42/32] |= (1 << (42%32));
task->workerids_len = 2;
```

One can also specify the order in which tasks must be executed by setting the `starpu_task::workerorder` field. If this field is set to a non-zero value, it provides the per-worker consecutive order in which tasks will be executed, starting from 1. For a given of such task, the worker will thus not execute it before all the tasks with smaller order value have been executed, notably in case those tasks are not available yet due to some dependencies. This eventually gives total control of task scheduling, and StarPU will only serve as a "self-timed" task runtime. Of course, the provided order has to be runnable, i.e. a task should should not depend on another task bound to the same worker with a bigger order.

Note however that using scheduling contexts while statically scheduling tasks on workers could be tricky. Be careful to schedule the tasks exactly on the workers of the corresponding contexts, otherwise the workers’ corresponding scheduling structures may not be allocated or the execution of the application may deadlock. Moreover, the hypervisor should not be used when statically scheduling tasks.

## 8.6 Defining A New Scheduling Policy

A full example showing how to define a new scheduling policy is available in the StarPU sources in the directory `examples/scheduler/`.

The scheduler has to provide methods:

```c
static struct starpu_sched_policy dummy_sched_policy = {
    .init_sched = init_dummy_sched,
    .deinit_sched = deinit_dummy_sched,
    .add_workers = dummy_sched_add_workers,
    .remove_workers = dummy_sched_remove_workers,
    .push_task = push_task_dummy,
    .pop_task = pop_task_dummy,
    .policy_name = "dummy",
    .policy_description = "dummy scheduling strategy"
};
```

The idea is that when a task becomes ready for execution, the `starpu_sched_policy::push_task` method is called. When a worker is idle, the `starpu_sched_policy::pop_task` method is called to get a task. It is up to the scheduler to implement what is between. A simple eager scheduler is for instance to make `starpu_sched_policy::push_task` push the task to a global list, and make `starpu_sched_policy::pop_task` pop from this list.

The `starpu_sched_policy` section provides the exact rules that govern the methods of the policy.

Make sure to have a look at the `Scheduling Policy` section, which provides a list of the available functions for writing advanced schedulers, such as `starpu_task_expected_length()`, `starpu_task_expected_data_transfer_time()`, `starpu_task_expected_energy()`, etc. Other useful functions include `starpu_transfer_bandwidth()`, `starpu_transfer_latency()`, `starpu_transfer_predict()`, ...

Usual functions can also be used on tasks, for instance one can do

```c
size = 0;
write = 0;
if (task->cl)
    for (i = 0; i < STARPU_TASK_GET_NBUFFERS(task); i++)
```
And various queues can be used in schedulers. A variety of examples of schedulers can be read in `src/sched_policies`, for instance `random_policy.c`, `eager_central_policy.c`, `work_stealing_policy.c`.

### 8.7 Graph-based Scheduling

For performance reasons, most of the schedulers shipped with StarPU use simple list-scheduling heuristics, assuming that the application has already set priorities. This is why they do their scheduling between when tasks become available for execution and when a worker becomes idle, without looking at the task graph. Other heuristics can however look at the task graph. Recording the task graph is expensive, so it is not available by default, the scheduling heuristic has to set `_starpu_graph_record` to 1 from the initialization function, to make it available. Then the `_starpu_graph_*` functions can be used. `src/sched_policies/graph_test_policy.c` is an example of simple greedy policy which automatically computes priorities by bottom-up rank.

The idea is that while the application submits tasks, they are only pushed to a bag of tasks. When the application is finished with submitting tasks, it calls `starpu_do_schedule()` (or `starpu_task_wait_for_all()`, which calls `starpu_do_schedule()`), and the `starpu_sched_policy::do_schedule` method of the scheduler is called. This method calls `_starpu_graph_compute_depths` to compute the bottom-up ranks, and then uses these rank to set priorities over tasks.

It then has two priority queues, one for CPUs, and one for GPUs, and uses a dumb heuristic based on the duration of the task over CPUs and GPUs to decide between the two queues. CPU workers can then pop from the CPU priority queue, and GPU workers from the GPU priority queue.

### 8.8 Debugging Scheduling

All the Online Performance Tools and Offline Performance Tools can be used to get information about how well the execution proceeded, and thus the overall quality of the execution. Precise debugging can also be performed by using the `STARPU_TASK_BREAK_ON_PUSH`, `STARPU_TASK_BREAK_ON_SCHED`, `STARPU_TASK_BREAK_ON_POP`, and `STARPU_TASK_BREAK_ON_EXEC` environment variables. By setting the job_id of a task in these environment variables, StarPU will raise `SIGTRAP` when the task is being scheduled, pushed, or popped by the scheduler. This means that when one notices that a task is being scheduled in a seemingly odd way, one can just reexecute the application in a debugger, with some of those variables set, and the execution will stop exactly at the scheduling points of this task, thus allowing to inspect the scheduler state, etc.
Chapter 9

Scheduling Contexts

9.1 General Ideas

Scheduling contexts represent abstract sets of workers that allow the programmers to control the distribution of computational resources (i.e., CPUs and GPUs) to concurrent kernels. The main goal is to minimize interferences between the execution of multiple parallel kernels, by partitioning the underlying pool of workers using contexts. Scheduling contexts additionally allow a user to make use of a different scheduling policy depending on the target resource set.

9.2 Creating A Context

By default, the application submits tasks to an initial context, which disposes of all the computation resources available to StarPU (all the workers). If the application programmer plans to launch several kernels simultaneously, by default these kernels will be executed within this initial context, using a single scheduler policy (see Task Scheduling Policies). Meanwhile, if the application programmer is aware of the demands of these kernels and of the specificity of the machine used to execute them, the workers can be divided between several contexts. These scheduling contexts will isolate the execution of each kernel and they will permit the use of a scheduling policy proper to each one of them.

Scheduling Contexts may be created in two ways: either the programmer indicates the set of workers corresponding to each context (providing he knows the identifiers of the workers running within StarPU), or the programmer does not provide any worker list and leaves the Hypervisor assign workers to each context according to their needs (Scheduling Context Hypervisor).

Both cases require a call to the function `starpu_sched_ctx_create()`, which requires as input the worker list (the exact list or a NULL pointer), the amount of workers (or -1 to designate all workers on the platform) and a list of optional parameters such as the scheduling policy, terminated by a 0. The scheduling policy can be a character list corresponding to the name of a StarPU predefined policy or the pointer to a custom policy. The function returns an identifier of the context created which you will use to indicate the context you want to submit the tasks to.

```c
/* the list of resources the context will manage */
int workerids[3] = {1, 3, 10};

/* indicate the list of workers assigned to it, the number of workers, the name of the context and the scheduling policy to be used within the context */
int id_ctx = starpu_sched_ctx_create(workerids, 3, "my_ctx",
STARPU_SCHED_CTX_POLICY_NAME, "dmda", 0);

/* let StarPU know that the following tasks will be submitted to this context */
starpu_sched_ctx_set_task_context(id);

/* submit the task to StarPU */
starpu_task_submit(task);
```

Note: Parallel greedy and parallel heft scheduling policies do not support the existence of several disjoint contexts on the machine. Combined workers are constructed depending on the entire topology of the machine, not only the one belonging to a context.
9.2.1 Creating A Context With The Default Behavior

If no scheduling policy is specified when creating the context, it will be used as another type of resource: a cluster. A cluster is a context without scheduler (eventually delegated to another runtime). For more information see Clustering A Machine. It is therefore mandatory to stipulate a scheduler to use the contexts in this traditional way.

To create a context with the default scheduler, that is either controlled through the environment variable STARPU_SCH or the StarPU default scheduler, one can explicitly use the option STARPU_SCHED_CTX_POLICY_NAME as in the following example:

```c
int id_ctx = starpu_sched_ctx_create(workerids, 3, "my_ctx", STARPU_SCHED_CTX_POLICY_NAME, "", 0);
```

9.3 Creating A Context

The contexts can also be used to group set of SMs of an NVIDIA GPU in order to isolate the parallel kernels and allow them to coexecution on a specified partition of the GPU. Each context will be mapped to a stream and the user can indicate the number of SMs. The context can be added to a larger context already grouping CPU cores. This larger context can use a scheduling policy that assigns tasks to both CPUs and contexts (partitions of the GPU) based on performance models adjusted to the number of SMs. The GPU implementation of the task has to be modified accordingly and receive as a parameter the number of SMs.

```c
int sched_ctx[nstreams];
sched_ctx[0] = starpu_sched_ctx_create(&stream_workerids[0], 1, "subctx", STARPU_SCHED_CTX_CUDA_NSMS, 6, 0);
sched_ctx[1] = starpu_sched_ctx_create(&stream_workerids[1], 1, "subctx", STARPU_SCHED_CTX_CUDA_NSMS, 7, 0);
```

9.4 Modifying A Context

A scheduling context can be modified dynamically. The application may change its requirements during the execution and the programmer can add additional workers to a context or remove those no longer needed. In the following example we have two scheduling contexts sched_ctx1 and sched_ctx2. After executing a part of the tasks some of the workers of sched_ctx1 will be moved to context sched_ctx2.

```c
starpu_sched_ctx_add_workers(workerids, 3, sched_ctx2);
```

9.5 Submitting Tasks To A Context

The application may submit tasks to several contexts either simultaneously or sequenially. If several threads of submission are used the function starpu_sched_ctx_set_context() may be called just before starpu_task_submit(). Thus StarPU considers that the current thread will submit tasks to the corresponding context.

```c
starpu_task_submit_to_ctx(task, big_sched_ctx);
```
9.6 Deleting A Context

When the application may not assign a thread of submission to each context, the id of the context must be indicated by using the function `starpu_task_submit_to_ctx()` or the field `STARPU_SCHED_CTX` for `starpu_task_insert()`.

9.6 Deleting A Context

When a context is no longer needed it must be deleted. The application can indicate which context should keep the resources of a deleted one. All the tasks of the context should be executed before doing this. Thus, the programmer may use either a barrier and then delete the context directly, or just indicate that other tasks will not be submitted later on to the context (such that when the last task is executed its workers will be moved to the inheritor) and delete the context at the end of the execution (when a barrier will be used eventually).

```c
/* when the context 2 is deleted context 1 inherits its resources */
starpu_sched_ctx_set_inheritor(sched_ctx2, sched_ctx1);

/* submit tasks to context 2 */
for (i = 0; i < ntasks; i++)
    starpu_task_submit_to_ctx(task[i], sched_ctx2);

/* indicate that context 2 finished submitting and that */
/* as soon as the last task of context 2 finished executing */
/* its workers can be moved to the inheritor context */
starpu_sched_ctx_finished_submit(sched_ctx1);

/* wait for the tasks of both contexts to finish */
starpu_task_wait_for_all();

/* delete context 2 */
starpu_sched_ctx_delete(sched_ctx2);

/* delete context 1 */
starpu_sched_ctx_delete(sched_ctx1);
```

9.7 Emptying A Context

A context may have no resources at the beginning or at a certain moment of the execution. Task can still be submitted to these contexts and they will be executed as soon as the contexts will have resources. A list of tasks pending to be executed is kept and when workers are added to the contexts these tasks start being submitted. However, if resources are never allocated to the context the program will not terminate. If these tasks have low priority the programmer can forbid the application to submit them by calling the function `starpu_sched_ctx_stop_task_submission()`.

Generated by Doxygen
Chapter 10

Scheduling Context Hypervisor

10.1 What Is The Hypervisor

StarPU proposes a platform to construct Scheduling Contexts, to delete and modify them dynamically. A parallel kernel, can thus be isolated into a scheduling context and interferences between several parallel kernels are avoided. If users know exactly how many workers each scheduling context needs, they can assign them to the contexts at their creation time or modify them during the execution of the program.

The Scheduling Context Hypervisor Plugin is available for users who do not dispose of a regular parallelism, who cannot know in advance the exact size of the context and need to resize the contexts according to the behavior of the parallel kernels.

The Hypervisor receives information from StarPU concerning the execution of the tasks, the efficiency of the resources, etc. and it decides accordingly when and how the contexts can be resized. Basic strategies of resizing scheduling contexts already exist but a platform for implementing additional custom ones is available.

10.2 Start the Hypervisor

The Hypervisor must be initialized once at the beginning of the application. At this point a resizing policy should be indicated. This strategy depends on the information the application is able to provide to the hypervisor as well as on the accuracy needed for the resizing procedure. For example, the application may be able to provide an estimation of the workload of the contexts. In this situation the hypervisor may decide what resources the contexts need. However, if no information is provided the hypervisor evaluates the behavior of the resources and of the application and makes a guess about the future. The hypervisor resizes only the registered contexts.

10.3 Interrogate The Runtime

The runtime provides the hypervisor with information concerning the behavior of the resources and the application. This is done by using the performance_counters which represent callbacks indicating when the resources are idle or not efficient, when the application submits tasks or when it becomes to slow.

10.4 Trigger the Hypervisor

The resizing is triggered either when the application requires it (sc_hypervisor_resize_ctxs()) or when the initials distribution of resources alters the performance of the application (the application is to slow or the resource are idle for too long time). If the environment variable SC_HYPERVISOR_TRIGGER_RESIZE is set to speed the monitored speed of the contexts is compared to a theoretical value computed with a linear program, and the resizing is triggered whenever the two values do not correspond. Otherwise, if the environment variable is set to idle the hypervisor triggers the resizing algorithm whenever the workers are idle for a period longer than the threshold indicated by the programmer. When this happens different resizing strategy are applied that target minimizing the total execution of the application, the instant speed or the idle time of the resources.
10.5 Resizing Strategies

The plugin proposes several strategies for resizing the scheduling context.

The **Application driven** strategy uses users’s input concerning the moment when they want to resize the contexts. Thus, users tag the task that should trigger the resizing process. One can set directly the field starpu_task::hypervisor_tag or use the macro STARPU_HYPERVISOR_TAG in the function starpu_task_insert().

```c
task.hypervisor_tag = 2;
```
or

```c
starpu_task_insert(&codelet,
    ...,
    STARPU_HYPERVISOR_TAG, 2,
    0);
```

Then users have to indicate that when a task with the specified tag is executed the contexts should resize.

```c
sc_hypervisor_resize(sched_ctx, 2);
```

Users can use the same tag to change the resizing configuration of the contexts if they consider it necessary.

```c
sc_hypervisor_ctl(sched_ctx,
    SC_HYPERVISOR_MIN_WORKERS, 6,
    SC_HYPERVISOR_MAX_WORKERS, 12,
    SC_HYPERVISOR_TIME_TO_APPLY, 2,
    NULL);
```

The **Idleness** based strategy moves workers unused in a certain context to another one needing them. (see Scheduling Context Hypervisor - Regular usage)

```c
int workerids[3] = {1, 3, 10};
int workerids2[9] = {0, 2, 4, 5, 6, 7, 8, 9, 11};
sc_hypervisor_ctl(sched_ctx_id,
    SC_HYPERVISOR_MAX_IDLE, workerids, 3, 10000.0,
    SC_HYPERVISOR_MAX_IDLE, workerids2, 9, 50000.0,
    NULL);
```

The **Gflops rate** based strategy resizes the scheduling contexts such that they all finish at the same time. The speed of each of them is computed and once one of them is significantly slower the resizing process is triggered. In order to do these computations users have to input the total number of instructions needed to be executed by the parallel kernels and the number of instruction to be executed by each task.

The number of flops to be executed by a context are passed as parameter when they are registered to the hypervisor, sc_hypervisor_register_ctx(sched_ctx_id, flops)

and the one to be executed by each task are passed when the task is submitted. The corresponding field is starpu_task::flops and the corresponding macro in the function starpu_task_insert() is STARPU_FLOPS (Caution: but take care of passing a double, not an integer, otherwise parameter passing will be bogus). When the task is executed the resizing process is triggered.

```c
task.flops = 100;
```
or

```c
starpu_task_insert(&codelet,
    ...,
    STARPU_FLOPS, (double) 100,
    0);
```

The **Feft** strategy uses a linear program to predict the best distribution of resources such that the application finishes in a minimum amount of time. As for the **Gflops rate** strategy the programmers has to indicate the total number of flops to be executed when registering the context. This number of flops may be updated dynamically during the execution of the application whenever this information is not very accurate from the beginning. The function sc_hypervisor_update_diff_total_flops() is called in order to add or to remove a difference to the flops left to be executed. Tasks are provided also the number of flops corresponding to each one of them. During the execution of the application the hypervisor monitors the consumed flops and recomputes the time left and the number of resources to use. The speed of each type of resource is (re)evaluated and inserter in the linear program in order to better adapt to the needs of the application.
The **Tef**t strategy uses a linear program too, that considers all the types of tasks and the number of each of them and it tries to allocates resources such that the application finishes in a minimum amount of time. A previous calibration of StarPU would be useful in order to have good predictions of the execution time of each type of task. The types of tasks may be determines directly by the hypervisor when they are submitted. However there are applications that do not expose all the graph of tasks from the beginning. In this case in order to let the hypervisor know about all the tasks the function `sc_hypervisor_set_type_of_task()` will just inform the hypervisor about future tasks without submitting them right away.

The **Ispeed** strategy divides the execution of the application in several frames. For each frame the hypervisor computes the speed of the contexts and tries making them run at the same speed. The strategy requires less contribution from users as the hypervisor requires only the size of the frame in terms of flops.

```
int workerids[3] = [1, 3, 10];
int workerids2[9] = [0, 2, 4, 5, 6, 7, 8, 9, 11];
sc_hypervisor_ctl(sched_ctx_id,
    SC_HYPERVISOR_ISPEED_W_SAMPLE, workerids, 3, 2000000000.0,
    SC_HYPERVISOR_ISPEED_W_SAMPLE, workerids2, 9, 200000000000.0,
    SC_HYPERVISOR_ISPEED_CTX_SAMPLE, 60000000000.0,
    NULL);
```

The **Throughput** strategy focuses on maximizing the throughput of the resources and resizes the contexts such that the machine is running at its maximum efficiency (maximum instant speed of the workers).

### 10.6 Defining A New Hypervisor Policy

While Scheduling Context Hypervisor Plugin comes with a variety of resizing policies (see Resizing Strategies), it may sometimes be desirable to implement custom policies to address specific problems. The API described below allows users to write their own resizing policy.

Here an example of how to define a new policy

```
struct sc_hypervisor_policy dummy_policy =
{
    .handle_poped_task = dummy_handle_poped_task,
    .handle_pushed_task = dummy_handle_pushed_task,
    .handle_idle_cycle = dummy_handle_idle_cycle,
    .handle_idle_end = dummy_handle_idle_end,
    .handle_post_exec_hook = dummy_handle_post_exec_hook,
    .custom = 1,
    .name = "dummy"
};
```
Chapter 11

Modularized Scheduler

11.1 Introduction

StarPU’s Modularized Schedulers are made of individual Scheduling Components Modularizedly assembled as a Scheduling Tree. Each Scheduling Component has an unique purpose, such as prioritizing tasks or mapping tasks over resources. A typical Scheduling Tree is shown below.

```
| starpu_push_task |
|                  |
| v
|
Fifo_Component
| ^
| |
| v
|
Eager_Component
| ^
| |
| v
--------------->
```

When a task is pushed by StarPU in a Modularized Scheduler, the task moves from a Scheduling Component to an other, following the hierarchy of the Scheduling Tree, and is stored in one of the Scheduling Components of the strategy. When a worker wants to pop a task from the Modularized Scheduler, the corresponding Worker Component of the Scheduling Tree tries to pull a task from its parents, following the hierarchy, and gives it to the worker if it succeeded to get one.

11.2 Using Modularized Schedulers

11.2.1 Existing Modularized Schedulers

StarPU is currently shipped with the following pre-defined Modularized Schedulers:

- Eager-based Schedulers (with/without prefetching):
  Naive scheduler, which tries to map a task on the first available resource it finds.

- Prio-based Schedulers (with/without prefetching):
  Similar to Eager-Based Schedulers. Can handle tasks which have a defined priority and schedule them accordingly.
• Random-based Schedulers (with/without prefetching):
  Selects randomly a resource to be mapped on for each task.

• HEFT Scheduler:
  Heterogeneous Earliest Finish Time Scheduler. This scheduler needs that every task submitted to StarPU
  have a defined performance model (Performance Model Calibration) to work efficiently, but can handle tasks
  without a performance model.

To use one of these schedulers, one can set the environment variable STARPU_SCHED. All modularized schedulers
are named following the RE tree-∗

11.2.2 An Example: The Tree-Eager-Prefetching Strategy

```
starpu_push_task |
    |
Fifo_Component     |
    ^      |
Push    Can_Push   |
    v      |
Eager_Component   |
    ^      |
    v      |
--------><-------------------><---------
    ^      |
Push    Can_Push   |
    v      |
Fifo_Component     |
    ^      |
Pull    Can_Pull   |
    v      |
Worker_Component   |
```

11.2.3 Interface

Each Scheduling Component must follow the following pre-defined Interface to be able to interact with other Scheduling
Components.

• Push (Caller_Component, Child_Component, Task)
  The calling Scheduling Component transfers a task to its Child Component. When the Push function returns,
  the task no longer belongs to the calling Component. The Modularized Schedulers' model relies on this
  function to perform prefetching. See starpu_sched_component::push_task for more details

• Pull (Caller_Component, Parent_Component) -> Task
  The calling Scheduling Component requests a task from its Parent Component. When the Pull function
  ends, the returned task belongs to the calling Component. See starpu_sched_component::pull_task for more
  details

• Can_Push (Caller_Component, Parent_Component)
  The calling Scheduling Component notifies its Parent Component that it is ready to accept new tasks. See
  starpu_sched_component::can_push for more details

• Can_Pull (Caller_Component, Child_Component)
  The calling Scheduling Component notifies its Child Component that it is ready to give new tasks. See
  starpu_sched_component::can_pull for more details

11.3 Building a Modularized Scheduler

Generated by Doxygen
11.3 Building a Modularized Scheduler

11.3.1 Pre-implemented Components

StarPU is currently shipped with the following four Scheduling Components:

- **Flow-control Components**: Fifo, Prio
  Components which store tasks. They can also prioritize them if they have a defined priority. It is possible to define a threshold for those Components following two criterias: the number of tasks stored in the Component, or the sum of the expected length of all tasks stored in the Component.

  "Core" of the Scheduling Strategy, those Components are the ones who make scheduling choices.

- **Worker Components**: Worker
  Each Worker Component modelize a concrete worker.

- **Special-Purpose Components**: Perfmodel_Select, Best_Implementation
  Components dedicated to original purposes. The Perfmodel_Select Component decides which Resource-Mapping Component should be used to schedule a task. The Best_Implementation Component chooses which implementation of a task should be used on the chosen resource.

11.3.2 Progression And Validation Rules

Some rules must be followed to ensure the correctness of a Modularized Scheduler:

- At least one Flow-control Component without threshold per Worker Component is needed in a Modularized Scheduler, to store incoming tasks from StarPU and to give tasks to Worker Components who asks for it. It is possible to use one Flow-control Component per Worker Component, or one for all Worker Components, depending on how the Scheduling Tree is defined.

- At least one Resource-Mapping Component is needed in a Modularized Scheduler. Resource-Mapping Components are the only ones who can make scheduling choices, and so the only ones who can have several child.

11.3.3 Implementing a Modularized Scheduler

The following code shows how the Tree-Eager-Prefetching Scheduler shown in Section An Example: The Tree-Eager-Prefetching Strategy is implemented:

```c
#define _STARPU_SCHED_NTASKS_THRESHOLD_DEFAULT 2
#define _STARPU_SCHED_EXP_LEN_THRESHOLD_DEFAULT 1000000000.0

static void initialize_eager_prefetching_center_policy(unsigned sched_ctx_id)
{
    unsigned ntasks_threshold = _STARPU_SCHED_NTASKS_THRESHOLD_DEFAULT;
    double exp_len_threshold = _STARPU_SCHED_EXP_LEN_THRESHOLD_DEFAULT;
    ...
    starpu_sched_ctx_create_worker_collection
        (sched_ctx_id, STARPU_WORKER_LIST);
    /* Create the Scheduling Tree */
    struct starpu_sched_tree * t = starpu_sched_tree_create(sched_ctx_id);
    /* The Root Component is a Flow-control Fifo Component */
    t->root = starpu_sched_component_fifo_create(NULL);
    /* The Resource-mapping Component of the strategy is an Eager Component */
    struct starpu_sched_component *eager_component =
        starpu_sched_component_eager_create(NULL);
    /* Create links between Components: the Eager Component is the child of the Root Component */
    t->root->add_child(t->root, eager_component);
    eager_component->add_father(eager_component, t->root);
    /* A task threshold is set for the Flow-control Components which will be connected to Worker Components. By doing so, this Modularized Scheduler will be able to perform some prefetching on the resources */
    ...
}
```

Generated by Doxygen
```c
struct starpu_sched_component_fifo_data fifo_data = {
    .ntasks_threshold = ntasks_threshold,
    .exp_len_threshold = exp_len_threshold,
};
unsigned i;
for(i = 0; i < starpu_worker_get_count() + starpu_combined_worker_get_count(); i++)
{
    /* Each Worker Component has a Flow-control Fifo Component as father */
    struct starpu_sched_component * worker_component =
        starpu_sched_component_worker_new(i);
    struct starpu_sched_component * fifo_component =
        starpu_sched_component_fifo_create(&fifo_data);
    fifo_component->add_child(fifo_component, worker_component);
    worker_component->add_father(worker_component, fifo_component);
    /* Each Flow-control Fifo Component associated to a Worker
     * Component is linked to the Eager Component as one of its children */
    eager_component->add_child(eager_component, fifo_component);
    fifo_component->add_father(fifo_component, eager_component);
}
starpu_sched_tree_update_workers(t);
starpu_sched_ctx_set_policy_data(sched_ctx_id, (void*)t);
}
```

## 11.4 Writing a Scheduling Component

### 11.4.1 Generic Scheduling Component

Each Scheduling Component is instantiated from a Generic Scheduling Component, which implements a generic version of the Interface. The generic implementation of Pull, Can_Pull and Can_Push functions are recursive calls to their parents (respectively to their children). However, as a Generic Scheduling Component do not know how much children it will have when it will be instantiated, it does not implement the Push function.

### 11.4.2 Instantiation : Redefining the Interface

A Scheduling Component must implement all the functions of the Interface. It is so necessary to implement a Push function to instantiate a Scheduling Component. The implemented Push function is the "fingerprint" of a Scheduling Component. Depending on how functionalities or properties the programmer wants to give to the Scheduling Component he is implementing, it is possible to reimplement all the functions of the Interface. For example, a Flow-control Component reimplements the Pull and the Can_Push functions of the Interface, allowing him to catch the generic recursive calls of these functions. The Pull function of a Flow-control Component can, for example, pop a task from the local storage queue of the Component, and give it to the calling Component which asks for it.
11.4 Writing a Scheduling Component

11.4.3 Detailed Progression and Validation Rules

- A Reservoir is a Scheduling Component which redefines a Push and a Pull function, in order to store tasks into it. A Reservoir delimit Scheduling Areas in the Scheduling Tree.

- A Pump is the engine source of the Scheduler: it pushes/pulls tasks to/from a Scheduling Component to another. Native Pumps of a Scheduling Tree are located at the root of the Tree (incoming Push calls from StarPU), and at the leafs of the Tree (Pop calls coming from StarPU Workers). Pre-implemented Scheduling Components currently shipped with Pumps are Flow-Control Components and the Resource-Mapping Component Heft, within their defined Can_Push functions.

- A correct Scheduling Tree requires a Pump per Scheduling Area and per Execution Flow.

The Tree-Eager-Prefetching Scheduler shown in Section An Example: The Tree-Eager-Prefetching Strategy follows the previous assumptions:

```
  starpu_push_task

Chapter 12

Debugging Tools

StarPU provides several tools to help debugging applications. Execution traces can be generated and displayed graphically, see Generating Traces With FxT.

12.1 TroubleShooting In General

Generally-speaking, if you have troubles, pass --enable-debug to ./configure to enable some checks which impact performance, but will catch common issues, possibly earlier than the actual problem you are observing, which may just be a consequence of a bug that happened earlier. Also, make sure not to have the --enable-fast option which drops very useful catchup assertions. If your program is valgrind-safe, you can use it, see Using Other Debugging Tools.

Depending on your toolchain, it might happen that you get undefined reference to '__stack_chk__guard' errors. In that case, use the --disable-fstack-protector-all option to avoid the issue. Then, if your program crashes with an assertion error, a segfault, etc. you can send us the result of thread apply all bt

run in gdb at the point of the crash.

In case your program just hangs, but it may also be useful in case of a crash too, it helps to source gdbinit as described in the next section to be able to run and send us the output of the following commands:

starpu-workers
starpu-tasks
starpu-print-requests
starpu-print-prequests
starpu-print-frrequests
starpu-print-irrequests

To give us an idea of what is happening within StarPU. If the outputs are not too long, you can even run

starpu-all-tasks
starpu-print-all-tasks
starpu-print-datas-summary
starpu-print-datas

12.2 Using The Gdb Debugger

Some gdb helpers are provided to show the whole StarPU state:

(gdb) source tools/gdbinit
(gdb) help starpu

For instance,

- one can print all tasks with starpu-print-all-tasks,
- print all datas with starpu-print-datas,
• print all pending data transfers with `starpu-print-prequests`, `starpu-print-requests`, `starpu-print-frequests`, `starpu-print-irequests`,

• print pending MPI requests with `starpu-mpi-print-detached-requests`

Some functions can only work if `--enable-debug` was passed to `./configure` (because they impact performance)

### 12.3 Using Other Debugging Tools

Valgrind can be used on StarPU: `valgrind.h` just needs to be found at `./configure` time, to tell valgrind about some known false positives and disable host memory pinning. Other known false positives can be suppressed by giving the suppression files in `tools/valgrind/*suppr` to valgrind's `-suppressions` option.

The environment variable `STARPU_DISABLE_KERNELS` can also be set to 1 to make StarPU do everything (schedule tasks, transfer memory, etc.) except actually calling the application-provided kernel functions, i.e. the computation will not happen. This permits to quickly check that the task scheme is working properly.

### 12.4 Using The Temanejo Task Debugger

StarPU can connect to Temanejo >= 1.0rc2 (see [http://www.hlrs.de/temanejo](http://www.hlrs.de/temanejo)), to permit nice visual task debugging. To do so, build Temanejo's `libayudame.so`, install `Ayudame.h` to e.g. `/usr/local/include`, apply the `tools/patch-ayudame` to it to fix C build, re-. `./configure`, make sure that it found it, rebuild StarPU. Run the Temanejo GUI, give it the path to your application, any options you want to pass it, the path to `libayudame.so`.

It permits to visualize the task graph, add breakpoints, continue execution task-by-task, and run `gdb` on a given task, etc.

Make sure to specify at least the same number of CPUs in the dialog box as your machine has, otherwise an error will happen during execution. Future versions of Temanejo should be able to tell StarPU the number of CPUs to use.
Tag numbers have to be below 4000000000000000000ULL to be usable for Temanejo (so as to distinguish them from tasks).
Chapter 13
Online Performance Tools

13.1 On-line Performance Feedback

13.1.1 Enabling On-line Performance Monitoring

In order to enable online performance monitoring, the application can call `starpu_profiling_status_set()` with the parameter `STARPU_PROFILING_ENABLE`. It is possible to detect whether monitoring is already enabled or not by calling `starpu_profiling_status_get()`. Enabling monitoring also reinitialize all previously collected feedback. The environment variable `STARPU_PROFILING` can also be set to 1 to achieve the same effect. The function `starpu_profiling_init()` can also be called during the execution to reinitialize performance counters and to start the profiling if the environment variable `STARPU_PROFILING` is set to 1. Likewise, performance monitoring is stopped by calling `starpu_profiling_status_set()` with the parameter `STARPU_PROFILING_DISABLE`. Note that this does not reset the performance counters so that the application may consult them later on.

More details about the performance monitoring API are available in Profiling.

13.1.2 Per-task Feedback

If profiling is enabled, a pointer to a structure `starpu_profiling_task_info` is put in the field `starpu_task::profiling_info` when a task terminates. This structure is automatically destroyed when the task structure is destroyed, either automatically or by calling `starpu_task_destroy()`.

The structure `starpu_profiling_task_info` indicates the date when the task was submitted (`starpu_profiling_task_info::submit_time`), started (`starpu_profiling_task_info::start_time`), and terminated (`starpu_profiling_task_info::end_time`), relative to the initialization of StarPU with `starpu_init()`. It also specifies the identifier of the worker that has executed the task (`starpu_profiling_task_info::workerid`). These date are stored as `timespec` structures which the user may convert into micro-seconds using the helper function `starpu_timing_timespec_to_us()`.

It is worth noting that the application may directly access this structure from the callback executed at the end of the task. The structure `starpu_task` associated to the callback currently being executed is indeed accessible with the function `starpu_task_get_current()`.

13.1.3 Per-codelet Feedback

The field `starpu_codelet::per_worker_stats` is an array of counters. The \( i \)-th entry of the array is incremented every time a task implementing the codelet is executed on the \( i \)-th worker. This array is not reinitialized when profiling is enabled or disabled.

13.1.4 Per-worker Feedback

The second argument returned by the function `starpu_profiling_worker_get_info()` is a structure `starpu_profiling_worker_info` that gives statistics about the specified worker. This structure specifies when StarPU started collecting profiling information for that worker (`starpu_profiling_worker_info::start_time`), the duration of the profiling measurement interval (`starpu_profiling_worker_info::total_time`), the time spent executing kernels (`starpu_profiling_worker_info::executing_time`), the time spent sleeping because there is no task to execute at all (`starpu_profiling_worker_info::sleeping_time`), and the number of tasks that were executed while profiling was enabled. These values give
an estimation of the proportion of time spent do real work, and the time spent either sleeping because there are not enough executable tasks or simply wasted in pure StarPU overhead.

Calling `starpu_profiling_worker_get_info()` resets the profiling information associated to a worker.

To easily display all this information, the environment variable `STARPU_WORKER_STATS` can be set to 1 (in addition to setting `STARPU_PROFILING` to 1). A summary will then be displayed at program termination:

Worker stats:
CUDA 0.0 (4.7 GiB)
480 task(s)
total: 1574.82 ms executing: 1510.72 ms sleeping: 0.00 ms overhead 64.10 ms
325.217970 GFlop/s

CPU 0
22 task(s)
total: 1574.82 ms executing: 1364.81 ms sleeping: 0.00 ms overhead 210.01 ms
7.512057 GFlop/s

CPU 1
14 task(s)
total: 1574.82 ms executing: 1500.13 ms sleeping: 0.00 ms overhead 74.69 ms
6.675853 GFlop/s

CPU 2
14 task(s)
total: 1574.82 ms executing: 1553.12 ms sleeping: 0.00 ms overhead 21.70 ms
7.152886 GFlop/s

The number of GFlops is available because the `starpu_task::flops` field of the tasks were filled (or `STARPU_FLOPS` used in `starpu_task_insert()`).

When an FxT trace is generated (see Generating Traces With FxT), it is also possible to use the tool `starpu_workers_activity` (see Monitoring Activity) to generate a graphic showing the evolution of these values during the time, for the different workers.

### 13.1.5 Bus-related Feedback

The bus speed measured by StarPU can be displayed by using the tool `starpu_machine_display`, for instance:

StarPU has found:
3 CUDA devices
CUDA 0 (Tesla C2050 02:00.0)
CUDA 1 (Tesla C2050 03:00.0)
CUDA 2 (Tesla C2050 84:00.0)

Statistics about the data transfers which were performed and temporal average of bandwidth usage can be obtained by setting the environment variable `STARPU_BUS_STATS` to 1; a summary will then be displayed at program termination:

Data transfer stats:
RAM 0 -> CUDA 0 319.92 MB 213.10 MB/s (transfers : 91 - avg 3.52 MB)
CUDA 0 -> RAM 0 214.45 MB 142.85 MB/s (transfers : 61 - avg 3.52 MB)
RAM 0 -> CUDA 1 302.34 MB 201.39 MB/s (transfers : 86 - avg 3.52 MB)
CUDA 1 -> RAM 0 133.59 MB 88.99 MB/s (transfers : 38 - avg 3.52 MB)
CUDA 0 -> CUDA 1 144.14 MB 96.01 MB/s (transfers : 41 - avg 3.52 MB)
CUDA 1 -> CUDA 0 130.08 MB 86.64 MB/s (transfers : 37 - avg 3.52 MB)
RAM 0 -> CUDA 2 312.89 MB 208.42 MB/s (transfers : 89 - avg 3.52 MB)
CUDA 2 -> RAM 0 133.59 MB 88.99 MB/s (transfers : 38 - avg 3.52 MB)
CUDA 0 -> CUDA 2 151.17 MB 100.69 MB/s (transfers : 43 - avg 3.52 MB)
CUDA 2 -> CUDA 0 105.47 MB 70.25 MB/s (transfers : 30 - avg 3.52 MB)
CUDA 1 -> CUDA 2 175.78 MB 117.09 MB/s (transfers : 50 - avg 3.52 MB)
CUDA 2 -> CUDA 1 203.91 MB 135.82 MB/s (transfers : 58 - avg 3.52 MB)
Total transfers: 2.27 GB
13.1.6 MPI-related Feedback

Statistics about the data transfers which were performed over MPI can be obtained by setting the environment variable `STARPU_COMM_STATS` to 1; a summary will then be displayed at program termination:

```
[starpu_comm_stats][0] TOTAL: 4.000000 GB 4.000000 GB  
[starpu_comm_stats][0->1] 4.000000 GB 4.000000 GB  
[starpu_comm_stats][1] TOTAL: 8.000000 GB 8.000000 GB  
[starpu_comm_stats][1->0] 8.000000 GB 8.000000 GB  
```

13.1.7 StarPU-Top Interface

StarPU-Top is an interface which remotely displays the on-line state of a StarPU application and permits the user to change parameters on the fly.

Variables to be monitored can be registered by calling the functions `starpu_top_add_data_boolean()`, `starpu_top_add_data_integer()`, `starpu_top_add_data_float()`, e.g.:

```
starpu_top_data *data = starpu_top_add_data_integer("mynum", 0, 1000, 1);  
```

The application should then call `starpu_top_init_and_wait()` to give its name and wait for StarPU-Top to get a start request from the user. The name is used by StarPU-Top to quickly reload a previously-saved layout of parameter display.

```
starpu_top_init_and_wait("the application");  
```

The new values can then be provided thanks to `starpu_top_update_data_boolean()`, `starpu_top_update_data_integer()`, `starpu_top_update_data_float()`, e.g.:

```
starpu_top_update_data_integer(data, mynum);  
```

Updateable parameters can be registered thanks to `starpu_top_register_parameter_boolean()`, `starpu_top_register_parameter_integer()`, `starpu_top_register_parameter_float()`, e.g.:

```
float alpha;  
starpu_top_register_parameter_float("alpha", &alpha, 0, 10, modif_hook);  
```

`modif_hook` is a function which will be called when the parameter is being modified, it can for instance print the new value:

```
void modif_hook(struct starpu_top_param *d)  
{  
fprintf(stderr,"%s has been modified: %f
\n", d->name, alpha);  
}  
```

Task schedulers should notify StarPU-Top when it has decided when a task will be scheduled, so that it can show it in its Gantt chart, for instance:

```
starpu_top_task_prevision(task, workerid, begin, end);  
```

Starting StarPU-Top (StarPU-Top is started via the binary `starpu_top`) and the application can be done in two ways:

- The application is started by hand on some machine (and thus already waiting for the start event). In the Preference dialog of StarPU-Top, the SSH checkbox should be unchecked, and the hostname and port (default is 2011) on which the application is already running should be specified. Clicking on the connection button will thus connect to the already-running application.

- StarPU-Top is started first, and clicking on the connection button will start the application itself (possibly on a remote machine). The SSH checkbox should be checked, and a command line provided, e.g.:

  ```
  $ ssh myserver STARPU_SCHED=dmda ./application  
  ```

  If port 2011 of the remote machine can not be accessed directly, an ssh port bridge should be added:

  ```
  $ ssh -L 2011:localhost:2011 myserver STARPU_SCHED=dmda ./application  
  ```

  and "localhost" should be used as IP Address to connect to.
13.2 Task And Worker Profiling

A full example showing how to use the profiling API is available in the StarPU sources in the directory examples/profiling/.

```c
struct starpu_task *task = starpu_task_create();
task->cl = &cl;
task->synchronous = 1;
/* We will destroy the task structure by hand so that we can
* query the profiling info before the task is destroyed. */
task->destroy = 0;

/* Submit and wait for completion (since synchronous was set to 1) */
starpu_task_submit(task);

/* The task is finished, get profiling information */
struct starpu_profiling_task_info *info = task->profiling_info;

/* How much time did it take before the task started ? */
double delay = starpu_timing_timespec_delay_us(&info->submit_time,
&info->start_time);

/* How long was the task execution ? */
double length = starpu_timing_timespec_delay_us(&info->start_time,
&info->end_time);

/* We no longer need the task structure */
starpu_task_destroy(task);

/* Display the occupancy of all workers during the test */
int worker;
for (worker = 0; worker < starpu_worker_get_count(); worker++)
{
    struct starpu_profiling_worker_info worker_info;
    int ret = starpu_profiling_worker_get_info(worker, &worker_info);
    STARPU_ASSERT(!ret);
    double total_time = starpu_timing_timespec_to_us(&worker_info.total_time);
    double executing_time = starpu_timing_timespec_to_us(&worker_info.executing_time);
    double sleeping_time = starpu_timing_timespec_to_us(&worker_info.sleeping_time);
    double overhead_time = total_time - executing_time - sleeping_time;
    float executing_ratio = 100.0*executing_time/total_time;
    float sleeping_ratio = 100.0*sleeping_time/total_time;
    float overhead_ratio = 100.0 - executing_ratio - sleeping_ratio;
    char workername[128];
    starpu_worker_get_name(worker, workername, 128);
    fprintf(stderr, "Worker %s: \
", workername);
    fprintf(stderr, "total time: %.2lf ms \n", total_time*1e-3);
    fprintf(stderr, "exec time: %.2lf ms (%.2f \%) \n", executing_time*1e-3, executing_ratio);
    fprintf(stderr, "blocked time: %.2lf ms (%.2f \%) \n", sleeping_time*1e-3, sleeping_ratio);
    fprintf(stderr, "overhead time: %.2lf ms (%.2f \%) \n", overhead_time*1e-3, overhead_ratio);
}
```

13.3 Performance Model Example

To achieve good scheduling, StarPU scheduling policies need to be able to estimate in advance the duration of a task. This is done by giving to codelets a performance model, by defining a structure starpu_perfmodel and providing its address in the field starpu_codelet::model. The fields starpu_perfmodel::symbol and starpu_perfmodel::type are mandatory, to give a name to the model, and the type of the model, since there are several kinds of performance models. For compatibility, make sure to initialize the whole structure to zero, either by using explicit memset(), or by letting the compiler implicitly do it as exemplified below.

- Measured at runtime (model type STARPU_HISTORY_BASED). This assumes that for a given set of data input/output sizes, the performance will always be about the same. This is very true for regular kernels on GPUs for instance (<0.1% error), and just a bit less true on CPUs (≈1% error). This also assumes that there are few different sets of data input/output sizes. StarPU will then keep record of the average time of previous executions on the various processing units, and use it as an estimation. History is done per task size, by using a hash of the input and output sizes as an index. It will also save it in $STARPU_HOME/.starpu/sampling/codelets for further executions, and can be observed by using the tool starpu_perfmodel_display, or drawn by using the tool starpu_perfmodel_plot (Performance Model Calibration). The models are indexed by machine name. To share the models between
machines (e.g. for a homogeneous cluster), use `export STARPU_HOSTNAME=some_global_name`. Measurements are only done when using a task scheduler which makes use of it, such as `dmda`. Measurements can also be provided explicitly by the application, by using the function `starpu_perfmodel_update_history()

The following is a small code example.

If e.g. the code is recompiled with other compilation options, or several variants of the code are used, the symbol string should be changed to reflect that, in order to recalibrate a new model from zero. The symbol string can even be constructed dynamically at execution time, as long as this is done before submitting any task using it.

```
static struct starpu_perfmodel mult_perf_model =
{
  .type = STARPU_HISTORY_BASED,
  .symbol = "mult_perf_model"
};
struct starpu_codelet cl =
{
  .cpu_funcs = { cpu_mult },
  .cpu_funcs_name = { "cpu_mult" },
  .nbuffers = 3,
  .modes = { STARPU_R, STARPU_R, STARPU_W },
  /* for the scheduling policy to be able to use performance models */
  .model = &mult_perf_model
};
```

• Measured at runtime and refined by regression (model types `STARPU_REGRESSION_BASED` and `STARPU_NL_REGRESSION_BASED`). This still assumes performance regularity, but works with various data input sizes, by applying regression over observed execution times. `STARPU_REGRESSION_BASED` uses an \( a n^b \) regression form, `STARPU_NL_REGRESSION_BASED` uses an \( a n^b + c \) (more precise than `STARPU_REGRESSION_BASED`, but costs a lot more to compute).

For instance, `tests/perfmodes/regression_based.c` uses a regression-based performance model for the function `memset()`.

Of course, the application has to issue tasks with varying size so that the regression can be computed. StarPU will not trust the regression unless there is at least 10% difference between the minimum and maximum observed input size. It can be useful to set the environment variable `STARPU_CALIBRATE` to 1 and run the application on varying input sizes with `STARPU_SCHED` set to `dmda` scheduler, so as to feed the performance model for a variety of inputs. The application can also provide the measurements explicitly by using the function `starpu_perfmodel_update_history()`. The tools `starpu_perfmodel_display` and `starpu_perfmodel_plot` can be used to observe how much the performance model is calibrated (Performance Model Calibration); when their output look good, `STARPU_CALIBRATE` can be reset to 0 to let StarPU use the resulting performance model without recording new measures, and `STARPU_SCHED` can be set to `dmda` to benefit from the performance models. If the data input sizes vary a lot, it is really important to set `STARPU_CALIBRATE` to 0, otherwise StarPU will continue adding the measures, and result with a very big performance model, which will take a lot of time to load and save.

For non-linear regression, since computing it is quite expensive, it is only done at termination of the application. This means that the first execution of the application will use only history-based performance model to perform scheduling, without using regression.

• Another type of model is `STARPU_MULTIPLE_REGRESSION_BASED`, which is based on multiple linear regression. In this model, the user defines both the relevant parameters and the equation for computing the task duration.

\[
T_{\text{kernel}} = a + b(M^{\alpha_1} N^{\beta_1} K^{\gamma_1}) + c(M^{\alpha_2} N^{\beta_2} K^{\gamma_2}) + ...$

\( M, N, K \) are the parameters of the task, added at the task creation. These need to be extracted by the `cl←_perf_func` function, which should be defined by the user. \( \alpha, \beta, \gamma \) are the exponents defined by the user in `model->combinations` table. Finally, coefficients \( a, b, c \) are computed automatically by the StarPU at the end of the execution, using least squares method of the `dgels` LAPACK function.

`examples/mlr/mlr.c` example provides more details on the usage of `STARPU_MULTIPLE_REGRESSION_BASED` models.
Coefficients computation is done at the end of the execution, and the results are stored in standard codelet perfmodel files. Additional files containing the duration of task together with the value of each parameter are stored in .starpu/sampling/codelets/tmp/ directory. These files are reused when STARPU_CALIBRATE environment variable is set to 1, to recompute coefficients based on the current, but also on the previous executions. Additionally, when multiple linear regression models are disabled (using "--disable-mlr" configuration option) or when the model->combinations are not defined, StarPU will still write output files into .starpu/sampling/codelets/tmp/ to allow performing an analysis. This analysis typically aims at finding the most appropriate equation for the codelet and tools/starpu_mlr_analysis script provides an example of how to perform such study.

- Provided as an estimation from the application itself (model type STARPU_COMMON and field starpu_perfmodel::cost_function), see for instance examples/common/blas_model.h and examples/common/blas_model.c.

- Provided explicitly by the application (model type STARPU_PER_ARCH): either field starpu_perfmodel::<arch::cost_function>, or the fields .per_arch[arch][nimpl].cost_function have to be filled with pointers to functions which return the expected duration of the task in micro-seconds, one per architecture, see for instance tests/datawizard/locality.c

For STARPU_HISTORY_BASED, STARPU_REGRESSION_BASED, and STARPU_NL_REGRESSION_BASED, the dimensions of task data (both input and output) are used as an index by default. STARPU_HISTORY_BASED uses a CRC hash of the dimensions as an index to distinguish histories, and STARPU_REGRESSION_BASED and STARPU_NL_REGRESSION_BASED use the total size as an index for the regression.

The starpu_perfmodel::size_base and starpu_perfmodel::footprint fields however permit the application to override that, when for instance some of the data do not matter for task cost (e.g. mere reference table), or when using sparse structures (in which case it is the number of non-zeros which matter), or when there is some hidden parameter such as the number of iterations, or when the application actually has a very good idea of the complexity of the algorithm, and just not the speed of the processor, etc. The example in the directory examples/pi uses this to include the number of iterations in the base size. starpu_perfmodel::size_base should be used when the variance of the actual performance is known (i.e. bigger returned value is longer execution time), and thus particularly useful for STARPU_REGRESSION_BASED or STARPU_NL_REGRESSION_BASED. starpu_perfmodel::footprint can be used when the variance of the actual performance is unknown (irregular performance behavior, etc.), and thus only useful for STARPU_HISTORY_BASED. starpu_task_data_footprint() can be used as a base and combined with other parameters through starpu_hash_crc32c_be() for instance.

StarPU will automatically determine when the performance model is calibrated, or rather, it will assume the performance model is calibrated until the application submits a task for which the performance can not be predicted. For STARPU_HISTORY_BASED, StarPU will require 10 (STARPU_CALIBRATE_MINIMUM) measurements for a given size before estimating that an average can be taken as estimation for further executions with the same size. For STARPU_REGRESSION_BASED and STARPU_NL_REGRESSION_BASED, StarPU will require 10 (STARPU_CALIBRATE_MINIMUM) measurements, and that the minimum measured data size is smaller than 90% of the maximum measured data size (i.e. the measurement interval is large enough for a regression to have a meaning).

Calibration can also be forced by setting the STARPU_CALIBRATE environment variable to 1, or even reset by setting it to 0.

How to use schedulers which can benefit from such performance model is explained in Task Scheduling Policies.

The same can be done for task energy consumption estimation, by setting the field starpu_codelet::energy_<model> the same way as the field starpu_codelet::model. Note: for now, the application has to give to the energy consumption performance model a name which is different from the execution time performance model.

The application can request time estimations from the StarPU performance models by filling a task structure as usual without actually submitting it. The data handles can be created by calling any of the functions starpu_*->data_register with a NULL pointer and -1 node and the desired data sizes, and need to be unregistered as usual. The functions starpu_task_expected_length() and starpu_task_expected_energy()) can then be called to get an estimation of the task cost on a given arch. starpu_task_footprint() can also be used to get the footprint used for indexing history-based performance models.starpu_task_destroy() needs to be called to destroy the dummy task afterwards. See tests/perfmodels/regression_based.c for an example.

### 13.4 Data trace and tasks length

It is possible to get statistics about tasks length and data size by using:

```bash
$ starpu_fxt_data_trace filename [codelet1 codelet2 ... codeletn]
```
Where filename is the FxT trace file and codeletX the names of the codelets you want to profile (if no names are specified, starpu_fxt_data_trace will profile them all). This will create a file, data_trace.gp which can be executed to get a .eps image of these results. On the image, each point represents a task, and each color corresponds to a codelet.
Chapter 14

Offline Performance Tools

To get an idea of what is happening, a lot of performance feedback is available, detailed in this chapter. The various informations should be checked for.

- What does the Gantt diagram look like? (see Creating a Gantt Diagram)
  - If it's mostly green (tasks running in the initial context) or context specific color prevailing, then the machine is properly utilized, and perhaps the codelets are just slow. Check their performance, see Performance Of Codelets.
  - If it's mostly purple (FetchingInput), tasks keep waiting for data transfers, do you perhaps have far more communication than computation? Did you properly use CUDA streams to make sure communication can be overlapped? Did you use data-locality aware schedulers to avoid transfers as much as possible?
  - If it's mostly red (Blocked), tasks keep waiting for dependencies, do you have enough parallelism? It might be a good idea to check what the DAG looks like (see Creating a DAG With Graphviz).
  - If only some workers are completely red (Blocked), for some reason the scheduler didn't assign tasks to them. Perhaps the performance model is bogus, check it (see Performance Of Codelets). Do all your codelets have a performance model? When some of them don't, the schedulers switches to a greedy algorithm which thus performs badly.

You can also use the Temanejo task debugger (see Using The Temanejo Task Debugger) to visualize the task graph more easily.

14.1 Off-line Performance Feedback

14.1.1 Generating Traces With FxT

StarPU can use the FxT library (see https://savannah.nongnu.org/projects/fkt/) to generate traces with a limited runtime overhead.

You can either get a tarball:

```
$ wget http://download.savannah.gnu.org/releases/fkt/fxt-0.2.11.tar.gz
```

or use the FxT library from CVS (autotools are required):

```
$ cvs -d :pserver:anonymous@cvs.sv.gnu.org:/sources/fkt co FxT
$ ./bootstrap
```

Compiling and installing the FxT library in the $FXTDIR path is done following the standard procedure:

```
$ ./configure --prefix=$FXTDIR
$ make
$ make install
```

In order to have StarPU to generate traces, StarPU should be configured with the option --with-fxt:

```
$ ./configure --with-fxt=$FXTDIR
```
Or you can simply point the `PKG_CONFIG_PATH` to `$FXTDIR/lib/pkgconfig` and pass `--with-fxt` to `./configure`.

When FxT is enabled, a trace is generated when StarPU is terminated by calling `starpu_shutdown()`. The trace is a binary file whose name has the form `prof_file_XXX_YYY` where `XXX` is the user name, and `YYY` is the pid of the process that used StarPU. This file is saved in the `/tmp/` directory by default, or by the directory specified by the environment variable `STARPU_FXT_PREFIX`.

The additional configure option `--enable-fxt-lock` can be used to generate trace events which describe the locks behaviour during the execution. It is however very heavy and should not be used unless debugging StarPU's internal locking.

The environment variable `STARPU_FXT_TRACE` can be set to 0 to disable the generation of the `prof_file_XXX_YYY` file.

When the FxT trace file `prof_file_something` has been generated, it is possible to generate different trace formats by calling:

```
$ starpu_fxt_tool -i /tmp/prof_file_something
```

Or alternatively, setting the environment variable `STARPU_GENERATE_TRACE` to 1 before application execution will make StarPU do it automatically at application shutdown.

One can also set the environment variable `STARPU_GENERATE_TRACE_OPTIONS` to specify options, see `starpu_fxt_tool -help`, for example:

```
$ export STARPU_GENERATE_TRACE=1
$ export STARPU_GENERATE_TRACE_OPTIONS="--no-acquire"
```

When running a MPI application, `STARPU_GENERATE_TRACE` will not work as expected (each node will try to generate trace files, thus mixing outputs...), you have to collect the trace files from the MPI nodes, and specify them all on the command `starpu_fxt_tool`, for instance:

```
$ starpu_fxt_tool -i /tmp/prof_file_something*
```

By default, the generated trace contains all informations. To reduce the trace size, various `--no-foo` options can be passed to `starpu_fxt_tool`, see `starpu_fxt_tool -help`.

### 14.1.1 Creating a Gantt Diagram

One of the generated files is a trace in the Paje format. The file, located in the current directory, is named `paje.trace`. It can be viewed with ViTE (http://vite.gforge.inria.fr/) a trace visualizing open-source tool. To open the file `paje.trace` with ViTE, use the following command:

```
$ vite paje.trace
```

Tasks can be assigned a name (instead of the default ‘unknown’) by filling the optional `starpu_codelet::name`, or assigning them a performance model. The name can also be set with the field `starpu_task::name` or by using `STARPU_NAME` when calling `starpu_task_insert()`.

Tasks are assigned default colors based on the worker which executed them (green for CPUs, yellow/orange/red for CUDAs, blue for OpenCLs, red for MIGs,...). To use a different color for every type of task, one can specify the option `-c` to `starpu_fxt_tool` or in `STARPU_GENERATE_TRACE_OPTIONS`. Tasks can also be given a specific color by setting the field `starpu_codelet::color` or the `starpu_task::color`. Colors are expressed with the following format 0xRRGGBB (e.g 0xFF0000 for red). See `basic_examples/task_insert_color` for examples on how to assign colors.

To identify tasks precisely, the application can also set the field `starpu_task::tag_id` or setting `STARPU_TAG_ONLY` when calling `starpu_task_insert()`. The value of the tag will then show up in the trace.

One can also introduce user-defined events in the diagram thanks to the function `starpu_fxt_trace_user_event_string()`.

One can also set the iteration number, by just calling `starpu_iteration_push()` at the beginning of submission loops and `starpu_iteration_pop()` at the end of submission loops. These iteration numbers will show up in traces for all tasks submitted from there.

Coordinates can also be given to data with the function `starpu_data_set_coordinates()` or `starpu_data_set_coordinates_array()` and in the trace, tasks will then be assigned the coordinates of the first data they write to.

Traces can also be inspected by hand by using the tool `fxt_print`, for instance:

```
$ fxt_print -o -f /tmp/prof_file_something
```

Timings are in nanoseconds (while timings as seen in ViTE are in milliseconds).
14.1.1.2 Creating a DAG With Graphviz

Another generated trace file is a task graph described using the DOT language. The file, created in the current directory, is named `dag.dot` file in the current directory. It is possible to get a graphical output of the graph by using the `graphviz` library:

```bash
$ dot -Tpdf dag.dot -o output.pdf
```

14.1.1.3 Getting Task Details

Another generated trace file gives details on the executed tasks. The file, created in the current directory, is named `tasks.rec`. This file is in the recutils format, i.e. `Field: value` lines, and empty lines to separate each task. This can be used as a convenient input for various ad-hoc analysis tools. By default it only contains information about the actual execution. Performance models can be obtained by running `starpu_tasks_rec_complete` on it:

```bash
$ starpu_tasks_rec_complete tasks.rec tasks2.rec
```

which will add `EstimatedTime` lines which contain the performance model-estimated time (in µs) for each worker starting from 0. Since it needs the performance models, it needs to be run the same way as the application execution, or at least with `STARPU_HOSTNAME` set to the hostname of the machine used for execution, to get the performance models of that machine.

Another possibility is to obtain the performance models as an auxiliary `perfmodel.rec` file, by using the `starpu_perfmodel_recdump` utility:

```bash
$ starpu_perfmodel_recdump tasks.rec -o perfmodel.rec
```

14.1.1.4 Monitoring Activity

Another generated trace file is an activity trace. The file, created in the current directory, is named `activity.data`. A profile of the application showing the activity of StarPU during the execution of the program can be generated:

```bash
$ starpu_workers_activity activity.data
```

This will create a file named `activity.eps` in the current directory. This picture is composed of two parts. The first part shows the activity of the different workers. The green sections indicate which proportion of the time was spent executed kernels on the processing unit. The red sections indicate the proportion of time spent in StarPU: an important overhead may indicate that the granularity may be too low, and that bigger tasks may be appropriate to use the processing unit more efficiently. The black sections indicate that the processing unit was blocked because there was no task to process: this may indicate a lack of parallelism which may be alleviated by creating more tasks when it is possible.

The second part of the picture `activity.eps` is a graph showing the evolution of the number of tasks available in the system during the execution. Ready tasks are shown in black, and tasks that are submitted but not schedulable yet are shown in grey.

14.1.1.5 Getting Modular Scheduler Animation

When using modular schedulers (i.e. schedulers which use a modular architecture, and whose name start with "modular-"), the call to `starpu_fxt_tool` will also produce a `trace.html` file which can be viewed in a javascript-enabled web browser. It shows the flow of tasks between the components of the modular scheduler.

14.1.2 Limiting The Scope Of The Trace

For computing statistics, it is useful to limit the trace to a given portion of the time of the whole execution. This can be achieved by calling

```c
starpu_fxt_autostart_profiling(0)
```

before calling `starpu_init()`, to prevent tracing from starting immediately. Then

```c
starpu_fxt_start_profiling();
```
and

```
starpu_fxt_stop_profiling();
```

can be used around the portion of code to be traced. This will show up as marks in the trace, and states of workers will only show up for that portion.

### 14.2 Performance Of Codelets

The performance model of codelets (see Performance Model Example) can be examined by using the tool `starpu_perfmodel_display`:

```
$ starpu_perfmodel_display -l
file: <malloc_pinned.hannibal>
file: <starpu_slu_lu_model_21.hannibal>
file: <starpu_slu_lu_model_11.hannibal>
file: <starpu_slu_lu_model_22.hannibal>
file: <starpu_slu_lu_model_12.hannibal>
```

Here, the codelets of the example `lu` are available. We can examine the performance of the kernel 22 (in microseconds), which is history-based:

```
$ starpu_perfmodel_display -s starpu_slu_lu_model_22
performance model for cpu
  # hash size mean   dev   n
57618ab0 19660800 2.851069e+05 1.829369e+04 109

performance model for cuda_0
  # hash size mean   dev   n
57618ab0 19660800 1.164144e+04 1.556094e+01 315

performance model for cuda_1
  # hash size mean   dev   n
57618ab0 19660800 1.164271e+04 1.330628e+01 360

performance model for cuda_2
  # hash size mean   dev   n
57618ab0 19660800 1.166730e+04 3.390395e+02 456
```

We can see that for the given size, over a sample of a few hundreds of execution, the GPUs are about 20 times faster than the CPUs (numbers are in us). The standard deviation is extremely low for the GPUs, and less than 10% for CPUs.

This tool can also be used for regression-based performance models. It will then display the regression formula, and in the case of non-linear regression, the same performance log as for history-based performance models:

```
$ starpu_perfmodel_display -s non_linear_memset_regression_based
performance model for cpu_impl_0
  Regression : #sample = 1400
  Linear: y = alpha size ^ beta
  alpha = 1.335973e-03
  beta = 8.024020e-01
  Non-Linear: y = a size ^b + c
  a = 9.654899e-01
  b = 9.009313e-01
  c = 3.90395e+00
  # hash size mean   dev   n
  a3d3725e 4096 4.763200e+00 7.650928e-01 100
  870a30aa 8192 1.827970e+00 2.037181e-01 100
  48e988e9 16384 2.652800e+00 1.876459e-01 100
  961e65d2 32768 4.255530e+00 3.518025e-01 100
  ...
```

The same can also be achieved by using StarPU's library API, see Performance Model and notably the function `starpu_perfmodel_load_symbol()`. The source code of the tool `starpu_perfmodel_display` can be a useful example.

The tool `starpu_perfmodel_plot` can be used to draw performance models. It writes a `.gp` file in the current directory, to be run with the tool `gnuplot`, which shows the corresponding curve.
When the field `starpu_task::flops` is set (or `STARPU_FLOPS` is passed to `starpu_task_insert()`) in STARPU, `perfmodel_plot` can directly draw a GFlops curve, by simply adding the `-f` option:

```
$ starpu_perfmodel_plot -f -s chol_model_11
```

This will however disable displaying the regression model, for which we can not compute GFlops.
When the FxT trace file `prof_file_something` has been generated, it is possible to get a profiling of each codelet by calling:

```
$ starpu_fxt_tool -i /tmp/prof_file_something
$ starpu_codelet_profile distrib.data codelet_name
```

This will create profiling data files, and a `distrib.data.gp` file in the current directory, which draws the distribution of codelet time over the application execution, according to data input size.
This is also available in the tool `starpu_perfmodel_plot`, by passing it the fxt trace:

```sh
$ starpu_perfmodel_plot -s non_linear_memset_regression_based -i /tmp/prof_file_foo_0
```

It will produce a `.gp` file which contains both the performance model curves, and the profiling measurements.
If you have the statistical tool \texttt{R} installed, you can additionally use

\$\texttt{starpu\_codelet\_histo\_profile distrib.data}\$

Which will create one \texttt{.pdf} file per codelet and per input size, showing a histogram of the codelet execution time distribution.

![Histogram of \texttt{val[\texttt{val} > \texttt{quantile(val, 0.01)} \& \texttt{val} < \texttt{quantile(val, 0.99)}]}](image)

### 14.3 Trace Statistics

More than just codelet performance, it is interesting to get statistics over all kinds of StarPU states (allocations, data transfers, etc.). This is particularly useful to check what may have gone wrong in the accuracy of the simgrid simulation.

This requires the \texttt{R} statistical tool, with the \texttt{plyr}, \texttt{ggplot2} and \texttt{data.table} packages. If your system distribution does not have packages for these, one can fetch them from \texttt{CRAN}:

\$\texttt{R}$

> \texttt{install.packages("plyr")}$

> \texttt{install.packages("ggplot2")}$

> \texttt{install.packages("data.table")}$

> \texttt{install.packages("knitr")}$
The `pj_dump` tool from pajeng is also needed (see https://github.com/schnorr/pajeng).
One can then get textual or `.csv` statistics over the trace states:

```bash
$ starpu_paje_state_stats -v native.trace simgrid.trace
"Value" "Events_native.csv" "Duration_native.csv" "Events_simgrid.csv" "Duration_simgrid.csv"
"Callback" 220 0.075978 220 0
"chol_model_11" 10 565.176 10 572.8695
"chol_model_21" 45 9184.828 45 9170.719
"chol_model_22" 165 64712.07 165 64299.203
$ starpu_paje_state_stats native.trace simgrid.trace
```

An other way to get statistics of StarPU states (without installing R and `pj_dump`) is to use the `starpu_trace_state_stats.py` script which parses the generated `trace.rec` file instead of the `paje.trace` file. The output is similar to the previous script but it doesn't need any dependencies.

The different prefixes used in `trace.rec` are:

- E: Event type
- N: Event name
- C: Event category
- W: Worker ID
- T: Thread ID
- S: Start time

Here's an example on how to use it:

```bash
$ python starpu_trace_state_stats.py trace.rec | column -t -s ","  
"Name" "Count" "Type" "Duration"
"Callback" 220 Runtime 0.075978
"chol_model_11" 10 Task 565.176
"chol_model_21" 45 Task 9184.828
"chol_model_22" 165 Task 64712.07
```

`starpu_trace_state_stats.py` can also be used to compute the different efficiencies. Refer to the usage
description to show some examples.
And one can plot histograms of execution times, of several states for instance:

```bash
$ starpu_paje_draw_histogram -n chol_model_11,chol_model_21,chol_model_22 native.trace simgrid.trace
```

and see the resulting pdf file:
A quick statistical report can be generated by using:

\$ starpu_paje_summary native.trace simgrid.trace

It includes gantt charts, execution summaries, as well as state duration charts and time distribution histograms. Other external Paje analysis tools can be used on these traces, one just needs to sort the traces by timestamp order (which not guaranteed to make recording more efficient):

\$ starpu_paje_sort paje.trace

### 14.4 Theoretical Lower Bound On Execution Time

StarPU can record a trace of what tasks are needed to complete the application, and then, by using a linear system, provide a theoretical lower bound of the execution time (i.e. with an ideal scheduling). The computed bound is not really correct when not taking into account dependencies, but for an application which have enough parallelism, it is very near to the bound computed with dependencies enabled (which takes a huge lot more time to compute), and thus provides a good-enough estimation of the ideal execution time. Theoretical Lower Bound On Execution Time Example provides an example on how to use this.
14.5 Theoretical Lower Bound On Execution Time Example

For kernels with history-based performance models (and provided that they are completely calibrated), StarPU can very easily provide a theoretical lower bound for the execution time of a whole set of tasks. See for instance examples/lu/lu_example.c: before submitting tasks, call the function starpu_bound_start(), and after complete execution, call starpu_bound_stop(). starpu_bound_print_lp() or starpu_bound_print_mps() can then be used to output a Linear Programming problem corresponding to the schedule of your tasks. Run it through lp_solve or any other linear programming solver, and that will give you a lower bound for the total execution time of your tasks. If StarPU was compiled with the library glpk installed, starpu_bound_compute() can be used to solve it immediately and get the optimized minimum, in ms. Its parameter integer allows to decide whether integer resolution should be computed and returned.

The deps parameter tells StarPU whether to take tasks, implicit data, and tag dependencies into account. Tags released in a callback or similar are not taken into account, only tags associated with a task are. It must be understood that the linear programming problem size is quadratic with the number of tasks and thus the time to solve it will be very long, it could be minutes for just a few dozen tasks. You should probably use lp_solve -timeout 1 test.pl -wmps test.mps to convert the problem to MPS format and then use a better solver, glpsol might be better than lp_solve for instance (the -pcost option may be useful), but sometimes doesn't manage to converge. cbc might look slower, but it is parallel. For lp_solve, be sure to try at least all the -B options. For instance, we often just use lp_solve -cc -B1 -Bb -Bg -Bp -Bf -Br -BG -Bd -Bs -BB -Bo -Bc -Bi, and the -gr option can also be quite useful. The resulting schedule can be observed by using the tool starpu_lp2paje, which converts it into the Paje format.

Data transfer time can only be taken into account when deps is set. Only data transfers inferred from implicit data dependencies between tasks are taken into account. Other data transfers are assumed to be completely overlapped.

Setting deps to 0 will only take into account the actual computations on processing units. It however still properly takes into account the varying performances of kernels and processing units, which is quite more accurate than just comparing StarPU performances with the fastest of the kernels being used.

The prio parameter tells StarPU whether to simulate taking into account the priorities as the StarPU scheduler would, i.e. schedule prioritized tasks before less prioritized tasks, to check to which extend this results to a less optimal solution. This increases even more computation time.

14.6 Memory Feedback

It is possible to enable memory statistics. To do so, you need to pass the option --enable-memory-stats when running configure. It is then possible to call the function starpu_data_display_memory_stats() to display statistics about the current data handles registered within StarPU.

Moreover, statistics will be displayed at the end of the execution on data handles which have not been cleared out. This can be disabled by setting the environment variable STARPU_MEMORY_STATS to 0.

For example, if you do not unregister data at the end of the complex example, you will get something similar to:

```
$ STARPU_MEMORY_STATS=0 ./examples/interface/complex
Complex[0] = 45.00 + 12.00 i
Complex[0] = 78.00 + 78.00 i
Complex[0] = 45.00 + 12.00 i
Complex[0] = 45.00 + 12.00 i

$ STARPU_MEMORY_STATS=1 ./examples/interface/complex
Complex[0] = 45.00 + 12.00 i
Complex[0] = 78.00 + 78.00 i
Complex[0] = 45.00 + 12.00 i
Complex[0] = 45.00 + 12.00 i

#---------------------

```

Generated by Doxygen
14.7 Data Statistics

Different data statistics can be displayed at the end of the execution of the application. To enable them, you need to define the environment variable `STARPU_ENABLE_STATS`. When calling `starpu_shutdown()` various statistics will be displayed, execution, MSI cache statistics, allocation cache statistics, and data transfer statistics. The display can be disabled by setting the environment variable `STARPU_STATS` to 0.

```
$ ./examples/cholesky/cholesky_tag
Computation took (in ms) 518.16
Synthetic GFlops : 44.21
#---------------------
MSI cache stats :
TOTAL MSI stats hit 1622 (66.23 %) miss 827 (33.77 %)
...

$ STARPU_STATS=0 ./examples/cholesky/cholesky_tag
Computation took (in ms) 518.16
Synthetic GFlops : 44.21
```
Chapter 15

Frequently Asked Questions

15.1 How To Initialize A Computation Library Once For Each Worker?

Some libraries need to be initialized once for each concurrent instance that may run on the machine. For instance, a C++ computation class which is not thread-safe by itself, but for which several instanciated objects of that class can be used concurrently. This can be used in StarPU by initializing one such object per worker. For instance, the libstarpu example does the following to be able to use FFTW on CPUs.

Some global array stores the instanciated objects:

```c
fftw_plan plan_cpu[STARPU_NMAXWORKERS];
```

At initialisation time of libstarpu, the objects are initialized:

```c
int workerid;
for (workerid = 0; workerid < starpu_worker_get_count(); workerid++)
{
    switch (starpu_worker_get_type(workerid))
    {
        case STARPU_CPU_WORKER:
            plan_cpu[workerid] = fftw_plan(...);
            break;
    }
}
```

And in the codelet body, they are used:

```c
static void fft(void *descr[], void *args)
{
    int workerid = starpu_worker_get_id();
    fftw_plan plan = plan_cpu[workerid];
    ...
    fftw_execute(plan, ...);
}
```

This however is not sufficient for FFT on CUDA: initialization has to be done from the workers themselves. This can be done thanks to starpu_execute_on_each_worker(). For instance libstarpu does the following.

```c
static void fft_plan_gpu(void *args)
{
    plan_plan = args;
    int n2 = plan->n2[0];
    int workerid = starpu_worker_get_id();

    cufftPlan1d(plan->plans[workerid].plan_cuda, n, CUFFT_C2C, 1);
    cufftSetStream(plan->plans[workerid].plan_cuda, starpu_cuda_get_local_stream());
}
void starpu_plan(void)
{
    starpu_execute_on_each_worker(fft_plan_gpu, plan, STARPU_CUDA);
}
```

15.2 Using The Driver API

Running Drivers
To add a new kind of device to the structure `starpu_driver`, one needs to:

1. Add a member to the union `starpu_driver::id`

2. Modify the internal function `_starpu_launch_drivers()` to make sure the driver is not always launched.

3. Modify the function `starpu_driver_run()` so that it can handle another kind of architecture.

4. Write the new function `_starpu_run_foobar()` in the corresponding driver.

### 15.3 On-GPU Rendering

Graphical-oriented applications need to draw the result of their computations, typically on the very GPU where these happened. Technologies such as OpenGL/CUDA interoperability permit to let CUDA directly work on the OpenGL buffers, making them thus immediately ready for drawing, by mapping OpenGL buffer, textures or renderbuffer objects into CUDA. CUDA however imposes some technical constraints: peer memcpy has to be disabled, and the thread that runs OpenGL has to be the one that runs CUDA computations for that GPU.

To achieve this with StarPU, pass the option `--disable-cuda-memcpy-peer` to `./configure` (TODO: make it dynamic), OpenGL/GLUT has to be initialized first, and the interoperability mode has to be enabled by using the field `starpu_conf::cuda_opengl_interoperability`, and the driver loop has to be run by the application, by using the field `starpu_conf::not_launched_drivers` to prevent StarPU from running it in a separate thread, and by using `starpu_driver_run()` to run the loop. The examples `gl_interop` and `gl_interop_idle` show how it articulates in a simple case, where rendering is done in task callbacks. The former uses `glutMainLoopEvent` to make GLUT progress from the StarPU driver loop, while the latter uses `glutIdleFunc` to make StarPU progress from the GLUT main loop.

Then, to use an OpenGL buffer as a CUDA data, StarPU simply needs to be given the CUDA pointer at registration, for instance:

```c
/* Get the CUDA worker id */
for (workerid = 0; workerid < starpu_worker_get_count(); workerid++)
    if (starpu_worker_get_type(workerid) == STARPU_CUDA_WORKER)
        break;

/* Build a CUDA pointer pointing at the OpenGL buffer */
cudaGraphicsResourceGetMappedPointer((void**)&output, &num_bytes, resource);

/* And register it to StarPU */
starpu_vector_data_register(&handle, starpu_worker_get_memory_node
    (workerid), output, num_bytes / sizeof(float4), sizeof(float4));

/* The handle can now be used as usual */
starpu_task_insert(&cl, STARPU_RW, handle, 0);

/* ... */

/* This gets back data into the OpenGL buffer */
starpu_data_unregister(handle);
```

and display it e.g. in the callback function.
15.4 Using StarPU With MKL 11 (Intel Composer XE 2013)

Some users had issues with MKL 11 and StarPU (versions 1.1rc1 and 1.0.5) on Linux with MKL, using 1 thread for MKL and doing all the parallelism using StarPU (no multithreaded tasks), setting the environment variable `MKL_NUM_THREADS` to 1, and using the threaded MKL library, with `iomp5`. Using this configuration, StarPU only uses 1 core, no matter the value of `STARPU_NCPU`. The problem is actually a thread pinning issue with MKL.

15.5 Thread Binding on NetBSD

When using StarPU on a NetBSD machine, if the topology discovery library `hwloc` is used, thread binding will fail. To prevent the problem, you should at least use the version 1.7 of `hwloc`, and also issue the following call:

```
$ sysctl -w security.models.extensions.user_set_cpu_affinity=1
```

Or add the following line in the file `/etc/sysctl.conf`

```
security.models.extensions.user_set_cpu_affinity=1
```

15.6 StarPU permanently eats 100% of all CPUs

Yes, this is on purpose.

By default, StarPU uses active polling on task queues, so as to minimize wake-up latency for better overall performance.

If eating CPU time is a problem (e.g. application running on a desktop), pass option `--enable-blocking-drivers` to `./configure`. This will add some overhead when putting CPU workers to sleep or waking them, but avoid eating 100% CPU permanently.

15.7 Interleaving StarPU and non-StarPU code

If your application only partially uses StarPU, and you do not want to call `starpu_init()` / `starpu_shutdown()` at the beginning/end of each section, StarPU workers will poll for work between the sections. To avoid this behavior, you can "pause" StarPU with the `starpu_pause()` function. This will prevent the StarPU workers from accepting new work (tasks that are already in progress will not be frozen), and stop them from polling for more work.

Note that this does not prevent you from submitting new tasks, but they won’t execute until `starpu_resume()` is called. Also note that StarPU must not be paused when you call `starpu_shutdown()`, and that this function pair works in a push/pull manner, i.e you need to match the number of calls to these functions to clear their effect.

One way to use these functions could be:

```
starpu_init(NULL);
starpu_pause(); // To submit all the tasks without a single one executing
submit_some_tasks();
starpu_resume(); // The tasks start executing

starpu_task_wait_for_all();
starpu_pause(); // Stop the workers from polling

starpu_resume();

starpu_shutdown();
```

15.8 When running with CUDA or OpenCL devices, I am seeing less CPU cores

Yes, this is on purpose.

Since GPU devices are way faster than CPUs, StarPU needs to react quickly when a task is finished, to feed the GPU with another task (StarPU actually submits a couple of tasks in advance so as to pipeline this, but filling the
pipeline still has to be happening often enough), and thus it has to dedicate threads for this, and this is a very
CPU-consuming duty. StarPU thus dedicates one CPU core for driving each GPU by default.
Such dedication is also useful when a codelet is hybrid, i.e. while kernels are running on the GPU, the codelet can
run some computation, which thus be run by the CPU core instead of driving the GPU.
One can choose to dedicate only one thread for all the CUDA devices by setting the STARPU_CUDA_THREAD←
_PER_DEV environment variable to 1. The application however should use STARPU_CUDA_ASYNC on its CUDA
codelets (asynchronous execution), otherwise the execution of a synchronous CUDA codelet will monopolize the
thread, and other CUDA devices will thus starve while it is executing.

15.9 StarPU does not see my CUDA device

First make sure that CUDA is properly running outside StarPU: build and run the following program with -lcudart:

```c
#include <stdio.h>
#include <cuda.h>
#include <cuda_runtime.h>

int main(void)
{
    int n, i, version;
    cudaError_t err;
    err = cudaGetDeviceCount(&n);
    if (err)
    {
        fprintf(stderr, "cuda error %d\n", err);
        exit(1);
    }
    cudaDriverGetVersion(&version);
    printf("driver version %d\n", version);
    cudaRuntimeGetVersion(&version);
    printf("runtime version %d\n", version);
    printf("\n");
    for (i = 0; i < n; i++)
    {
        struct cudaDeviceProp props;
        printf("CUDA%d\n", i);
        err = cudaGetDeviceProperties(&props, i);
        if (err)
        {
            fprintf(stderr, "cuda error %d\n", err);
            continue;
        }
        printf("%s\n", props.name);
        printf("%0.3f GB\n", (float) props.totalGlobalMem / (1<<30));
        printf("%u MP\n", props.multiProcessorCount);
        printf("\n");
    }
    return 0;
}
```

If that program does not find your device, the problem is not at the StarPU level, but the CUDA drivers, check the
documentation of your CUDA setup.

15.10 StarPU does not see my OpenCL device

First make sure that OpenCL is properly running outside StarPU: build and run the following program with -lOpenCL:

```c
#include <CL/cl.h>
#include <stdio.h>
#include <assert.h>

int main(void)
{
    cl_device_id did[16];
    cl_int err;
    cl_platform_id pid, pids[16];
    cl_uint npplat, nb;
    char buf[128];
    size_t size;
    int i, j;

    err = clGetPlatformIDs(sizeof(pids)/sizeof(pids[0]), pids, &npplat);
    assert(err == CL_SUCCESS);
```
15.11 I keep getting a "Incorrect performance model file" error

The performance model file, used by StarPU to record the performance of codelets, seem to have been corrupted. Perhaps a previous run of StarPU stopped abruptly, and thus could not save it properly. You can have a look at the file if you can fix it, but the simplest way is to just remove the file and run again, StarPU will just have to re-perform calibration for the corresponding codelet.

If that program does not find your device, the problem is not at the StarPU level, but the OpenCL drivers, check the documentation of your OpenCL implementation.
Part IV

StarPU Extensions
Chapter 16

Out Of Core

16.1 Introduction

When using StarPU, one may need to store more data than what the main memory (RAM) can store. This part describes the method to add a new memory node on a disk and to use it. Similarly to what happens with GPUs (it's actually exactly the same code), when available main memory becomes scarce, StarPU will evict unused data to the disk, thus leaving room for new allocations. Whenever some evicted data is needed again for a task, StarPU will automatically fetch it back from the disk.

The principle is that one first registers a disk location, seen by StarPU as a \texttt{void*}, which can be for instance a Unix path for the stdio, unistd or unistd\_o\_direct backends, or a leveldb database for the leveldb backend, an HDF5 file path for the HDF5 backend, etc. The disk backend opens this place with the plug method.

StarPU can then start using it to allocate room and store data there with the disk write method, without user intervention.

The user can also use \texttt{starpu\_disk\_open()} to explicitly open an object within the disk, e.g. a file name in the stdio or unistd cases, or a database key in the leveldb case, and then use \texttt{starpu\_*\_register} functions to turn it into a StarPU data handle. StarPU will then use this file as external source of data, and automatically read and write data as appropriate.

16.2 Use a new disk memory

To use a disk memory node, you have to register it with this function:

\begin{verbatim}
int new_dd = starpu_disk_register(&starpu_disk_unistd_ops, (void*) "/tmp/", 1024*1024*200);
\end{verbatim}

Here, we use the unistd library to realize the read/write operations, i.e. fread/fwrite. This structure must have a path where to store files, as well as the maximum size the software can afford storing on the disk.

Don't forget to check if the result is correct!

This can also be achieved by just setting environment variables:

\begin{verbatim}
export STARPU\_DISK\_SWAP=/tmp
export STARPU\_DISK\_SWAP\_BACKEND=unistd
export STARPU\_DISK\_SWAP\_SIZE=200
\end{verbatim}

The backend can be set to stdio (some caching is done by libc), unistd (only caching in the kernel), unistd\_o\_direct (no caching), leveldb, or hdf5.

When that register call is made, StarPU will benchmark the disk. This can take some time.

\textbf{Warning: the size thus has to be at least STARPU\_DISK\_SIZE\_MIN bytes !}

StarPU will then automatically try to evict unused data to this new disk. One can also use the standard StarPU memory node API to prefetch data etc., see the Standard Memory Library and the Data Interfaces.

The disk is unregistered during the \texttt{starpu\_shutdown()}.  

16.3 Data Registration

StarPU will only be able to achieve Out-Of-Core eviction if it controls memory allocation. For instance, if the application does the following:
p = malloc(1024*1024*sizeof(float)); fill_with_data(p); starpu_matrix_data_register(&h, STARPU_MAIN_RAM, (uintptr_t) p, 1024, 1024, 1024, sizeof(float));

StarPU will not be able to release the corresponding memory since it's the application which allocated it, and StarPU can not know how, and thus how to release it. One thus have to use the following instead:

starpu_matrix_data_register(&h, -1, NULL, 1024, 1024, 1024, sizeof(float));

Which makes StarPU automatically do the allocation when the task running cl_fill_with_data gets executed. And then if its needs to, it will be able to release it after having pushed the data to the disk.

16.4 Using Wont Use

By default, StarPU uses a Least-Recently-Used (LRU) algorithm to determine which data should be evicted to the disk. This algorithm can be hinted by telling which data will no be used in the coming future thanks to `starpu_data_wont_use()`, for instance:

starpu_task_insert(&cl_work, STARPU_RW, h, 0); starpu_data_wont_use(h);

StarPU will mark the data as "inactive" and tend to evict to the disk that data rather than others.

16.5 Examples: disk_copy

/* Try to write into disk memory
 * Use mechanism to push datas from main ram to disk ram
 */
#include <starpu.h>
#include <stdlib.h>
#include <stdio.h>
#include <math.h>
/* size of one vector */
#define NX (30*1000000/sizeof(double))
#define FPRINTF(ofile, fmt, ...) do { if (!getenv("STARPU_SSILENT")) {fprintf(ofile, fmt, ## __VA_ARGS__); } } while(0)

int main(int argc, char **argv)
{
    double * A,*B,*C,*D,*E,*F;
    /* limit main ram to force to push in disk */
    setenv("STARPU_LIMIT_CPU_MEM", "160", 1);

    /* Initialize StarPU with default configuration */
    int ret = starpu_init(NULL);
    if (ret == -ENODEV) goto enodev;

    /* register a disk */
    int new_dd = starpu_disk_register(&starpu_disk_unistd_ops, (void *) "/tmp/", 1024*1024*200);
    if (new_dd == -ENOENT) goto enoent;

    /* allocate two memory spaces */
    starpu_malloc_flags((void**) &A, NX*sizeof(double), STARPU_MALLOC_COUNT);
    starpu_malloc_flags((void**) &F, NX*sizeof(double), STARPU_MALLOC_COUNT);

    FPRINTF(stderr, "TEST DISK MEMORY \n");

    unsigned int j;
    /* initialization with bad values */
    for(j = 0; j < NX; ++j)
    {
        A[j] = j;
        F[j] = -j;
    }

    starpu_data_handle_t vector_handleA, vector_handleB, vector_handleC,
    vector_handleD, vector_handleE, vector_handleF;
    /* register vector in starpu */
    starpu_vector_data_register(&vector_handleA, STARPU_MAIN_RAM

16.6 Examples: disk_compute

/* Try to write into disk memory
   * Use mechanism to push datas from main ram to disk ram *
*/
#include <starpu.h>
#include <stdlib.h>
#include <stdio.h>
#include <sys/types.h>
#include <unistd.h>
#include <math.h>
#define NX (1024)

int main(int argc, char **argv)
{
    /* Initialize StarPU with default configuration */
    int ret = starpu_init(NULL);
    if (ret == -ENODEV) goto enodev;
    /* Initialize path and name */
    char pid_str[16];
    int pid = getpid();
    snprintf(pid_str, sizeof(pid_str), "%d", pid);
    starpu_free_flags(A, NX*sizeof(double), STARPU_MALLOC_COUNT);
    starpu_free_flags(F, NX*sizeof(double), STARPU_MALLOC_COUNT);
    /* try to write into disk memory */
    starpu_data_unregister(vector_handleA);
    starpu_data_unregister(vector_handleB);
    starpu_data_unregister(vector_handleC);
    for (j = 0; j < NX; ++j)
    { if (A[j] != F[j])
        { printf("Fail A %.1f != F %.1f \n", A[j], F[j]);
          try = 0;
        }
    }
    /* free last vectors */
    starpu_free_flags(A, NX*sizeof(double), STARPU_MALLOC_COUNT);
    starpu_free_flags(F, NX*sizeof(double), STARPU_MALLOC_COUNT);
    /* terminate StarPU, no task can be submitted after */
    starpu_shutdown();
    if(try) FPRINTF(stderr, "TEST SUCCESS\n");
    else FPRINTF(stderr, "TEST FAIL\n");
    return (try ? EXIT_SUCCESS : EXIT_FAILURE);
}

enodev:
    return 77;
enoent:
    return 77;
const char *name_file_start = "STARPU_DISK_COMPUTE_DATA_";
const char *name_file_end = "STARPU_DISK_COMPUTE_DATA_RESULT_";

char *path_file_start = malloc(strlen(base) + 1 + strlen(name_file_start) + 1);
strcpy(path_file_start, base);
strcat(path_file_start, "/");
strcat(path_file_start, name_file_start);
char *path_file_end = malloc(strlen(base) + 1 + strlen(name_file_end) + 1);
strcpy(path_file_end, base);
strcat(path_file_end, "/");
strcat(path_file_end, name_file_end);

/* register a disk */
int new_dd = starpu_disk_register(&starpu_disk_unistd_ops
, (void *) base, 1024*1024*1);
/* can't write on /tmp/ */
if (new_dd == -ENOENT) goto enoent;
unsigned dd = (unsigned) new_dd;
printf("TEST DISK MEMORY

");
/* Imagine, you want to compute datas */
int *A;
int *C;
starpu_malloc_flags((void **)&A, NX*sizeof(int), STARPU_MALLOC_COUNT
);
starpu_malloc_flags((void **)&C, NX*sizeof(int), STARPU_MALLOC_COUNT
);
unsigned int j;
/* you register them in a vector */
for(j = 0; j < NX; ++j)
{
    A[j] = j;
    C[j] = 0;
}
/* you create a file to store the vector ON the disk */
FILE *f = fopen(path_file_start, "wb+");
if (f == NULL)
    goto enoent2;
/* store it in the file */
fwrite(A, sizeof(int), NX, f);
/* close the file */
close(f);

/* create a file to store result */
f = fopen(path_file_end, "wb+");
if (f == NULL)
    goto enoent2;
/* replace all datas by 0 */
fwrite(C, sizeof(int), NX, f);
/* close the file */
close(f);
/* And now, you want to use your datas in StarPU */
/* Open the file ON the disk */
void *data = starpu_disk_open(dd, (void *) name_file_start, NX*sizeof(int));
void *data_result = starpu_disk_open(dd, (void *) name_file_end, NX*sizeof(int));
starpu_data_handle_t vector_handleA, vector_handleC;
/* register vector in starpu */
starpu_vector_data_register(&vector_handleA, dd, (uintptr_t) data, NX,
sizeof(int));
/* and do what you want with it, here we copy it into an other vector */
starpu_vector_data_register(&vector_handleC, dd, (uintptr_t) data_result
, NX, sizeof(int));
starpu_data_cpy(vector_handleC, vector_handleA, 0, NULL, NULL);
/* free them */
starpu_data_unregister(vector_handleA);
starpu_data_unregister(vector_handleC);
/* close them in StarPU */
starpu_disk_close(dd, data, NX*sizeof(int));
16.7 Performances

Scheduling heuristics for Out-of-core are still relatively experimental. The tricky part is that you usually have to find a compromise between privileging locality (which avoids back and forth with the disk) and privileging the critical path, i.e. taking into account priorities to avoid lack of parallelism at the end of the task graph. It is notably better to avoid defining different priorities to tasks with low priority, since that will make the scheduler want to schedule them by levels of priority, at the expense of locality. The scheduling algorithms worth trying are thus dmdar and lws, which privilege data locality over priorities. There will be work on this area in the coming future.

16.8 Disk functions

There are various ways to operate a disk memory node, described by the structure starpu_disk_ops. For instance, the variable starpu_disk_unistd_ops uses read/write functions. All structures are in Out Of Core.
Chapter 17

MPI Support

The integration of MPI transfers within task parallelism is done in a very natural way by the means of asynchronous interactions between the application and StarPU. This is implemented in a separate libstarpumpi library which basically provides "StarPU" equivalents of MPI_* functions, where void* buffers are replaced with starpu←data_handle_t, and all GPU-RAM-NIC transfers are handled efficiently by StarPU-MPI. The user has to use the usual mpirun command of the MPI implementation to start StarPU on the different MPI nodes.

An MPI Insert Task function provides an even more seamless transition to a distributed application, by automatically issuing all required data transfers according to the task graph and an application-provided distribution.

17.1 Example used in this documentation

The example below will be used as the base for this documentation. It initializes a token on node 0, and the token is passed from node to node, incremented by one on each step. The code is not using StarPU yet.

```c
for (loop = 0; loop < nloops; loop++)
{
    int tag = loop*size + rank;
    if (loop == 0 && rank == 0)
    {  // Start with token value %d\n", token);
        token = 0;
    }
    else
    {
        MPI_Recv(&token, 1, MPI_INT, (rank+size-1)%size, tag, MPI_COMM_WORLD);
    }
    token++;
    if (loop == last_loop && rank == last_rank)
    {  // Finished: token value %d\n", token);
        fprintf(stdout, "Finished: token value %d\n", token);
    }
    else
    {
        MPI_Send(&token, 1, MPI_INT, (rank+1)%size, tag+1, MPI_COMM_WORLD);
    }
}
```

17.2 About not using the MPI support

Although StarPU provides MPI support, the application programmer may want to keep his MPI communications as they are for a start, and only delegate task execution to StarPU. This is possible by just using starpu_data_acquire(), for instance:

```c
for (loop = 0; loop < nloops; loop++)
{
    int tag = loop*size + rank;
    /* Acquire the data to be able to write to it */
    starpu_data_acquire(token_handle, STARPU_W);
    if (loop == 0 && rank == 0)
    {  // Start with token value %d\n", token);
        token = 0;
    }
```
In that case, libstarpumpi is not needed. One can also use MPI_Isend() and MPI_Irecv(), by calling starpu_data_acquire() after MPI_Wait() or MPI_Test() have notified completion.

It is however better to use libstarpumpi, to save the application from having to synchronize with starpu_data_acquire(), and instead just submit all tasks and communications asynchronously, and wait for the overall completion.

### 17.3 Simple Example

The flags required to compile or link against the MPI layer are accessible with the following commands:

```bash
$ pkg-config --cflags starpumpi-1.3  # options for the compiler
$ pkg-config --libs starpumpi-1.3    # options for the linker
```

```c
void increment_token(void)
{
    struct starpu_task *task = starpu_task_create();
    task->cl = &increment_cl;
    task->handles[0] = token_handle;
    starpu_task_submit(task);
}
```

```c
int main(int argc, char **argv)
{
    int rank, size;
    starpu_init(NULL);
    starpu_mpi_init(&argc, &argv, 1);
    starpu_mpi_comm_rank(MPI_COMM_WORLD, &rank);
    starpu_mpi_comm_size(MPI_COMM_WORLD, &size);
    starpu_vector_data_register(&token_handle, STARPU_MAIN_RAM, (uintptr_t)&token, 1, sizeof(unsigned));
    unsigned nloops = NITER;
    unsigned loop;
    unsigned last_loop = nloops - 1;
    unsigned last_rank = size - 1;
    for (loop = 0; loop < nloops; loop++)
    {
        int tag = loop*size + rank;
        if (loop == 0 && rank == 0)
        {
            starpu_data_acquire(token_handle, STARPU_W);
            token = 0;
            fprintf(stdout, "Start with token value %d\n", token);
            starpu_data_release(token_handle);
        }
        else
        {
            starpu_mpi_irecv_detached(token_handle, (rank+size-1)%size, tag,
                MPI_COMM_WORLD, NULL, NULL);
        }
```
increment_token();

if (loop == last_loop && rank == last_rank)
{
    starpu_data_acquire(token_handle, STARPU_R);
    fprintf(stdout, "Finished: token value %d\n", token);
    starpu_data_release(token_handle);
}
else
{
    starpu_mpi_isend_detached(token_handle, (rank+1)%size, tag+1,
    MPI_COMM_WORLD, NULL, NULL);
}

starpu_task_wait_for_all();
starpu_mpi_shutdown();
starpu_shutdown();

if (rank == last_rank)
{
    fprintf(stderr, "[%d] token = %d == %d * %d ?\n", rank, token, nloops, size);
    STARPU_ASSERT(token == nloops*size);
}

We have here replaced MPI_Recv() and MPI_Send() with starpu_mpi_irecv_detached() and starpu_mpi_isend_detached(), which just submit the communication to be performed. The implicit sequential consistency dependencies provide synchronization between mpi reception and emission and the corresponding tasks. The only remaining synchronization with starpu_data_acquire() is at the beginning and the end.

17.4 How to Initialize StarPU-MPI

As seen in the previous example, one has to call starpu_mpi_init() to initialize StarPU-MPI. The third parameter of the function indicates if MPI should be initialized by StarPU or if the application will do it itself. If the application initializes MPI itself, it must call MPI_Init_thread() with MPI_THREAD_SERIALIZED or MPI_THREAD_MULTIPLE, since StarPU-MPI uses a separate thread to perform the communications. MPI_THREAD_MULTIPLE is necessary if the application also performs some MPI communications.

17.5 Point To Point Communication

The standard point to point communications of MPI have been implemented. The semantic is similar to the MPI one, but adapted to the DSM provided by StarPU. A MPI request will only be submitted when the data is available in the main memory of the node submitting the request.

There are two types of asynchronous communications: the classic asynchronous communications and the detached communications. The classic asynchronous communications (starpu_mpi_isend() and starpu_mpi_irecv()) need to be followed by a call to starpu_mpi_wait() or to starpu_mpi_test() to wait for or to test the completion of the communication. Waiting for or testing the completion of detached communications is not possible, this is done internally by StarPU-MPI, on completion, the resources are automatically released. This mechanism is similar to the pthread detach state attribute which determines whether a thread will be created in a joinable or a detached state.

For send communications, data is acquired with the mode STARPU_R. When using the configure option --enable-mpi-pedantic-isend, the mode STARPU_RW is used to make sure there is no more than 1 concurrent MPI_Isend call accessing a data.

Internally, all communication are divided in 2 communications, a first message is used to exchange an envelope describing the data (i.e its tag and its size), the data itself is sent in a second message. All MPI communications submitted by StarPU uses a unique tag which has a default value, and can be accessed with the functions starpu_mpi_get_communication_tag() and starpu_mpi_set_communication_tag(). The matching of tags with corresponding requests is done within StarPU-MPI.

For any userland communication, the call of the corresponding function (e.g starpu_mpi_isend()) will result in the creation of a StarPU-MPI request, the function starpu_data_acquire_cb() is then called to asynchronously request StarPU to fetch the data in main memory; when the data is ready and the corresponding buffer has already been received by MPI, it will be copied in the memory of the data, otherwise the request is stored in the early requests list. Sending requests are stored in the ready requests list.
While requests need to be processed, the StarPU-MPI progression thread does the following:

1. it polls the *ready requests list*. For all the ready requests, the appropriate function is called to post the corresponding MPI call. For example, an initial call to `starpu_mpi_isend()` will result in a call to `MPI_Isend()`. If the request is marked as detached, the request will then be added in the *detached requests list*.

2. it posts a `MPI_Irecv()` to retrieve a data envelope.

3. it polls the *detached requests list*. For all the detached requests, it tests its completion of the MPI request by calling `MPI_Test()`. On completion, the data handle is released, and if a callback was defined, it is called.

4. finally, it checks if a data envelope has been received. If so, if the data envelope matches a request in the *early requests list* (i.e. the request has already been posted by the application), the corresponding MPI call is posted (similarly to the first step above).

If the data envelope does not match any application request, a temporary handle is created to receive the data, a StarPU-MPI request is created and added into the *ready requests list*, and thus will be processed in the first step of the next loop.

**MPIPtpCommunication** gives the list of all the point to point communications defined in StarPU-MPI.

### 17.6 Exchanging User Defined Data Interface

New data interfaces defined as explained in **Defining A New Data Interface** can also be used within StarPU-MPI and exchanged between nodes. Two functions needs to be defined through the type `starpu_data_interface_ops`. The function `starpu_data_interface_ops::pack_data` takes a handle and returns a contiguous memory buffer allocated with:

```c
starpu_malloc_flags(ptr, size, 0)
```

along with its size where data to be conveyed to another node should be copied. The reversed operation is implemented in the function `starpu_data_interface_ops::unpack_data` which takes a contiguous memory buffer and recreates the data handle.

```c
static int complex_pack_data(starpu_data_handle_t handle, unsigned node, void **ptr, ssize_t *count)
{
    STARPU_ASSERT(starpu_data_test_if_allocated_on_node(handle, node));
    struct starpu_complex_interface *complex_interface = (struct starpu_complex_interface *)starpu_data_get_interface_on_node(handle, node);
    *count = complex_get_size(handle);
    starpu_malloc_flags(ptr, *count, 0);
    memcpy(*ptr, complex_interface->real, complex_interface->nx*sizeof(double));
    memcpy(*ptr+complex_interface->nx*sizeof(double), complex_interface->imaginary, complex_interface->nx*sizeof(double));
    return 0;
}
```

```c
static int complex_unpack_data(starpu_data_handle_t handle, unsigned node, void *ptr, size_t count)
{
    STARPU_ASSERT(starpu_data_test_if_allocated_on_node(handle, node));
    struct starpu_complex_interface *complex_interface = (struct starpu_complex_interface *)starpu_data_get_interface_on_node(handle, node);
    memcpy(complex_interface->real, ptr, complex_interface->nx*sizeof(double));
    memcpy(complex_interface->imaginary, ptr+complex_interface->nx*sizeof(double), complex_interface->nx*sizeof(double));
    return 0;
}
```

```c
static struct starpu_data_interface_ops interface_complex_ops = {
    ...
    .pack_data = complex_pack_data,
    .unpack_data = complex_unpack_data
};
```
Instead of defining pack and unpack operations, users may want to attach a MPI type to their user defined data interface. The function `starpu_mpi_datatype_register()` allows to do so. This function takes 3 parameters: the data handle for which the MPI datatype is going to be defined, a function's pointer that will create the MPI datatype, and a function's pointer that will free the MPI datatype.

```c
starpu_data_interface handle;
starpu_complex_data_register(&handle, STARPU_MAIN_RAM, real, imaginary, 2);
starpu_mpi_datatype_register(handle, starpu_complex_interface_datatype_allocate,
starpu_complex_interface_datatype_free);
```

The functions to create and free the MPI datatype are defined as follows.

```c
void starpu_complex_interface_datatype_allocate(starpu_data_handle_t handle,
MPI_Datatype *mpi_datatype)
{
    int ret;
    int blocklengths[2];
    MPI_Aint displacements[2];
    MPI_Datatype types[2] = {MPI_DOUBLE, MPI_DOUBLE};

    struct starpu_complex_interface *complex_interface = (struct starpu_complex_interface *)
starpu_data_get_interface_on_node(handle, STARPU_MAIN_RAM);

    MPI_Address(complex_interface, displacements);
    MPI_Address(&complex_interface->imaginary, displacements+1);
    displacements[1] -= displacements[0];
    displacements[0] = 0;
    blocklengths[0] = complex_interface->nx;
    blocklengths[1] = complex_interface->nx;

    ret = MPI_Type_create_struct(2, blocklengths, displacements, types, mpi_datatype);
    STARPU_ASSERT_MSG(ret == MPI_SUCCESS, "MPI_Type_contiguous failed");
    ret = MPI_Type_commit(mpi_datatype);
    STARPU_ASSERT_MSG(ret == MPI_SUCCESS, "MPI_Type_commit failed");
}

void starpu_complex_interface_datatype_free(MPI_Datatype *mpi_datatype)
{
    MPI_Type_free(mpi_datatype);
}
```

Note that it is important to make sure no communication is going to occur before the function `starpu_mpi_datatype_register()` is called. This would produce an undefined result as the data may be received before the function is called, and so the MPI datatype would not be known by the StarPU-MPI communication engine, and the data would be processed with the pack and unpack operations.

```c
starpu_data_interface handle;
starpu_complex_data_register(handle, STARPU_MAIN_RAM, real, imaginary, 2);
starpu_mpi_datatype_register(handle, starpu_complex_interface_datatype_allocate,
starpu_complex_interface_datatype_free);
starpu_mpi_barrier(MPI_COMM_WORLD);
```

## 17.7 MPI Insert Task Utility

To save the programmer from having to explicit all communications, StarPU provides an "MPI Insert Task Utility". The principle is that the application decides a distribution of the data over the MPI nodes by allocating it and notifying StarPU of this decision, i.e. tell StarPU which MPI node "owns" which data. It also decides, for each handle, an MPI tag which will be used to exchange the content of the handle. All MPI nodes then process the whole task graph, and StarPU automatically determines which node actually execute which task, and trigger the required MPI transfers.

The list of functions is described in MPIInsertTask.

Here an stencil example showing how to use `starpu_mpi_task_insert()`. One first needs to define a distribution function which specifies the locality of the data. Note that the data needs to be registered to MPI by calling `starpu_mpi_data_register()`. This function allows to set the distribution information and the MPI tag which should be used when communicating the data. It also allows to automatically clear the MPI communication cache when unregistering the data.

```c
/* Returns the MPI node number where data is */
int my_distrib(int x, int y, int nb_nodes)
{
    /* Block distrib */
```
return ((int)(x / sqrt(nb_nodes) + (y / sqrt(nb_nodes)) * sqrt(nb_nodes))) % nb_nodes;

// /* Other examples useful for other kinds of computations */
// /* */ / distrib */
// return (x+y) % nb_nodes;
// /* Block cyclic distrib */
// unsigned side = sqrt(nb_nodes);
// return x % side + (y % side) % size;
}

Now the data can be registered within StarPU. Data which are not owned but will be needed for computations can be registered through the lazy allocation mechanism, i.e. with a home_node set to -1. StarPU will automatically allocate the memory when it is used for the first time.

One can note an optimization here (the else if test): we only register data which will be needed by the tasks that we will execute.

unsigned matrix[X][Y];

for(x = 0; x < X; x++)
{
    for (y = 0; y < Y; y++)
    {
        int mpi_rank = my_distrib(x, y, size);
        if (mpi_rank == my_rank)
            /* Owning data */
            starpu_variable_data_register(&data_handles[x][y], STARPU_MAIN_RAM
            , (uintptr_t)&(matrix[x][y]), sizeof(unsigned));
        else if (my_rank == my_distrib(x+1, y, size) || my_rank == my_distrib(x-1, y, size)
                  || my_rank == my_distrib(x, y+1, size) || my_rank == my_distrib(x, y-1, size))
            /* I don’t own this index, but will need it for my computations */
            starpu_variable_data_register(&data_handles[x][y], -1, (uintptr_t)
            NULL, sizeof(unsigned));
        else
            /* I know it’s useless to allocate anything for this */
            if (data_handles[x][y])
                starpu_mpi_data_register(data_handles[x][y], x*X+y, mpi_rank);
    }
}

Now starpu_mpi_task_insert() can be called for the different steps of the application.

for(loop=0 ; loop<niter; loop++)
for (x = 1; x < X-1; x++)
for (y = 1; y < Y-1; y++)
    starpu_mpi_task_insert(MPI_COMM_WORLD, &stencil5_cl,
    STARPU_RW, data_handles[x][y],
    STARPU_R, data_handles[x-1][y],
    STARPU_R, data_handles[x+1][y],
    STARPU_R, data_handles[x][y-1],
    STARPU_R, data_handles[x][y+1],
    0);

I.e. all MPI nodes process the whole task graph, but as mentioned above, for each task, only the MPI node which owns the data being written to (here, data_handles[x][y]) will actually run the task. The other MPI nodes will automatically send the required data.

To tune the placement of tasks among MPI nodes, one can use STARPU_EXECUTE_ON_NODE or STARPU_EXECUTE_ON_DATA to specify an explicit node, or the node of a given data (e.g. one of the parameters), or use starpu_mpi_node_selection_register_policy() and STARPU_NODE_SELECTION_POLICY to provide a dynamic policy.

A function starpu_mpi_task_build() is also provided with the aim to only construct the task structure. All MPI nodes need to call the function, which posts the required send/recv on the various nodes which have to. Only the node which is to execute the task will then return a valid task structure, others will return NULL. This node must submit the task. All nodes then need to call the function starpu_mpi_task_post_build() – with the same list of arguments as starpu_mpi_task_build() – to post all the necessary data communications meant to happen after the task execution.

struct starpu_task *task;

    task = starpu_mpi_task_build(MPI_COMM_WORLD, &cl,
    STARPU_RW, data_handles[0],
    STARPU_R, data_handles[1],
    0);

    if (task) starpu_task_submit(task);
17.8 Pruning MPI task insertion

Making all MPI nodes process the whole graph can be a concern with a growing number of nodes. To avoid this, the application can prune the task for loops according to the data distribution, so as to only submit tasks on nodes which have to care about them (either to execute them, or to send the required data).

A way to do some of this quite easily can be to just add an if like this:

```c
for (loop=0 ; loop<niter; loop++)
    for (x = 1; x < X-1; x++)
        for (y = 1; y < Y-1; y++)
            if (my_distrib(x,y,size) == my_rank
                || my_distrib(x-1,y,size) == my_rank
                || my_distrib(x+1,y,size) == my_rank
                || my_distrib(x,y-1,size) == my_rank
                || my_distrib(x,y+1,size) == my_rank)
                starpu_mpi_task_insert(MPI_COMM_WORLD, &stencil5_cl,
                                      STARPU_RW, data_handles[x][y],
                                      STARPU_R, data_handles[x-1][y],
                                      STARPU_R, data_handles[x+1][y],
                                      STARPU_R, data_handles[x][y-1],
                                      STARPU_R, data_handles[x][y+1],
                                      0);
```

This permits to drop the cost of function call argument passing and parsing.

If the `my_distrib` function can be inlined by the compiler, the latter can improve the test.

If the `size` can be made a compile-time constant, the compiler can considerably improve the test further.

If the distribution function is not too complex and the compiler is very good, the latter can even optimize the for loops, thus dramatically reducing the cost of task submission.

To estimate quickly how long task submission takes, and notably how much pruning saves, a quick and easy way is to measure the submission time of just one of the MPI nodes. This can be achieved by running the application on just one MPI node with the following environment variables:

```bash
export STARPU_DISABLE_KERNELS=1
export STARPU_MPI_FAKE_RANK=2
export STARPU_MPI_FAKE_SIZE=1024
```

Here we have disabled the kernel function call to skip the actual computation time and only keep submission time, and we have asked StarPU to fake running on MPI node 2 out of 1024 nodes.

17.9 Temporary Data

To be able to use `starpu_mpi_task_insert()`, one has to call `starpu_mpi_data_register()`, so that StarPU-MPI can know what it needs to do for each data. Parameters of `starpu_mpi_data_register()` are normally the same on all nodes for a given data, so that all nodes agree on which node owns the data, and which tag is used to transfer its value.

It can however be useful to register e.g. some temporary data on just one node, without having to register a dumb handle on all nodes, while only one node will actually need to know about it. In this case, nodes which will not need the data can just pass NULL to `starpu_mpi_task_insert()`:

```c
starpu_data_handle_t data0 = NULL;
if (rank == 0) {
    starpu_variable_data_register(&data0, STARPU_MAIN_RAM,
                                  (uintptr_t) &val0, sizeof(val0));
    starpu_mpi_data_register(data0, 0, rank);
}
starpu_mpi_task_insert(MPI_COMM_WORLD, &cl, STARPU_R, data0, 0); /* Executes on node 0 */
```

Here, nodes whose rank is not 0 will simply not take care of the data, and consider it to be on another node. This can be mixed various way, for instance here node 1 determines that it does not have to care about data0, but knows that it should send the value of its data1 to node 0, which owns data and thus will need the value of data1 to execute the task:
MPI Support

```c
starpu_data_handle_t data0 = NULL, data1, data;
if (rank == 0)
{
    starpu_variable_data_register(&data0, STARPU_MAIN_RAM,
        (uintptr_t) &val0, sizeof(val0));
    starpu_mpi_data_register(data0, -1, rank);
    starpu_variable_data_register(&data1, -1, 0, sizeof(val1));
    starpu_variable_data_register(data, STARPU_MAIN_RAM, 
        (uintptr_t) &val, sizeof(val));
} else if (rank == 1)
{
    starpu_variable_data_register(&data1, STARPU_MAIN_RAM,
        (uintptr_t) &val1, sizeof(val1));
    starpu_variable_data_register(&data, -1, 0, sizeof(val));
}
starpu_mpi_data_register(data, 42, 0);
starpu_mpi_data_register(data1, 43, 1);
starpu_mpi_task_insert(MPI_COMM_WORLD, &cl, STARPU_W, data, STARPU_R, 
data0, STARPU_R, data1, 0); /* Executes on node 0 */
```

### 17.10 Per-node Data

Further than temporary data on just one node, one may want per-node data, to e.g. replicate some computation because that is less expensive than communicating the value over MPI:

```c
starpu_data_handle pernode, data0, data1;
starpu_variable_data_register(&pernode, -1, 0, sizeof(val));
starpu_mpi_data_register(pernode, -1, STARPU_MPI_PER_NODE);
/* Normal data: one on node0, one on node1 */
if (rank == 0)
{
    starpu_variable_data_register(&data0, STARPU_MAIN_RAM,
        (uintptr_t) &val0, sizeof(val0));
    starpu_variable_data_register(&data1, -1, 0, sizeof(val1));
} else if (rank == 1)
{
    starpu_variable_data_register(&data0, -1, 0, sizeof(val1));
    starpu_variable_data_register(&data1, STARPU_MAIN_RAM,
        (uintptr_t) &val1, sizeof(val1));
}
starpu_mpi_data_register(data0, 42, 0);
starpu_mpi_data_register(data1, 43, 1);
starpu_mpi_task_insert(MPI_COMM_WORLD, &cl, STARPU_W, pernode, 0); /* Will be 
replicated on all nodes */
starpu_mpi_task_insert(MPI_COMM_WORLD, &cl2, STARPU_RW, data0, STARPU_R, 
pernode); /* Will execute on node 0, using its own pernode*/
starpu_mpi_task_insert(MPI_COMM_WORLD, &cl2, STARPU_RW, data1, STARPU_R, 
pernode); /* Will execute on node 1, using its own pernode*/
```

One can turn a normal data into pernode data, by first broadcasting it to all nodes:

```c
starpu_data_handle data;
starpu_variable_data_register(&data, -1, 0, sizeof(val));
starpu_mpi_data_register(data, 42, 0);
/* Compute some value */
starpu_mpi_task_insert(MPI_COMM_WORLD, &cl, STARPU_W, data, 0); /* Node 0 computes it */
/* Get it on all nodes */
starpu_mpi_get_data_on_all_nodes_detached(MPI_COMM_WORLD, data);
/* And turn it per-node */
starpu_mpi_data_set_rank(data, STARPU_MPI_PER_NODE);
```

The data can then be used just like pernode above.

### 17.11 Priorities

All send functions have a `_prio` variant which takes an additional priority parameter, which allows to make StarPU-MPI change the order of MPI requests before submitting them to MPI. The default priority is 0.

When using the `starpu_mpi_task_insert` helper, `STARPU_PRIORITY` defines both the task priority and the MPI requests priority.

To test how much MPI priorities have a good effect on performance, you can set the environment variable `STARPU_MPI_PRIORITIES` to 0 to disable the use of priorities in StarPU-MPI.
17.12 MPI cache support

StarPU-MPI automatically optimizes duplicate data transmissions: if an MPI node B needs a piece of data D from MPI node A for several tasks, only one transmission of D will take place from A to B, and the value of D will be kept on B as long as no task modifies D.

If a task modifies D, B will wait for all tasks which need the previous value of D, before invalidating the value of D. As a consequence, it releases the memory occupied by D. Whenever a task running on B needs the new value of D, allocation will take place again to receive it.

Since tasks can be submitted dynamically, StarPU-MPI can not know whether the current value of data D will again be used by a newly-submitted task before being modified by another newly-submitted task, so until a task is submitted to modify the current value, it can not decide by itself whether to flush the cache or not. The application can however explicitly tell StarPU-MPI to flush the cache by calling `starpu_mpi_cache_flush()` or `starpu_mpi_cache_flush_all_data()`, for instance in case the data will not be used at all any more (see for instance the cholesky example in `mpi/examples/matrix_decomposition`), or at least not in the close future. If a newly-submitted task actually needs the value again, another transmission of D will be initiated from A to B. A mere `starpu_mpi_cache_flush()` can for instance be added at the end of the whole algorithm, to express that no data will be reused after this (or at least that it is not interesting to keep them in cache). It may however be interesting to add fine-graph `starpu_mpi_cache_flush()` calls during the algorithm; the effect for the data deallocation will be the same, but it will additionally release some pressure from the StarPU-MPI cache hash table during task submission.

One can determine whether a piece of is cached with `starpu_mpi_cached_receive()` and `starpu_mpi_cached_send()`.

The whole caching behavior can be disabled thanks to the `STARPU_MPI_CACHE` environment variable. The variable `STARPU_MPI_CACHE_STATS` can be set to 1 to enable the runtime to display messages when data are added or removed from the cache holding the received data.

17.13 MPI Data migration

The application can dynamically change its mind about the data distribution, to balance the load over MPI nodes for instance. This can be done very simply by requesting an explicit move and then change the registered rank. For instance, we here switch to a new distribution function `my_distrib2`: we first register any data which wasn’t registered already and will be needed, then migrate the data, and register the new location.

```c
for(x = 0; x < X; x++)
    for (y = 0; y < Y; y++)
        if (data_handles[x][y])
            /* Register newly-needed data */
            starpu_variable_data_register(&data_handles[x][y], -1, (uintptr_t)NULL, sizeof(unsigned));
        else
            /* Migrate the data */
            starpu_mpi_data_migrate(MPI_COMM_WORLD, data_handles[x][y], mpi_rank);
```

From then on, further tasks submissions will use the new data distribution, which will thus change both MPI communications and task assignments.

Very importantly, since all nodes have to agree on which node owns which data so as to determine MPI communications and task assignments the same way, all nodes have to perform the same data migration, and at the same point among task submissions. It thus does not require a strict synchronization, just a clear separation of task submissions before and after the data redistribution.

Before data unregistration, it has to be migrated back to its original home node (the value, at least), since that is where the user-provided buffer resides. Otherwise the unregistration will complain that it does not have the latest value on the original home node.

```c
for(x = 0; x < X; x++)
    for (y = 0; y < Y; y++)
        if (data_handles[x][y])
            /* Unregister the data */
            starpu_variable_data_unregister(data_handles[x][y], mpi_rank);
```

Generated by Doxygen
int mpi_rank = my_distrib(x, y, size);
/* Get back data to original place where the user-provided buffer is. */
starpu_mpi_get_data_on_node_detached(MPI_COMM_WORLD,
  data_handles[x][y], mpi_rank, NULL, NULL);
/* And unregister it */
starpu_data_unregister(data_handles[x][y]);
}

17.14 MPI Collective Operations

The functions are described in MPICollectiveOperations.

if (rank == root)
{
  /* Allocate the vector */
  vector = malloc(nblocks * sizeof(float *));
  for(x=0 ; x<nblocks ; x++)
  {
    starpu_malloc((void **)&vector[x], block_size*sizeof(float));
  }
}

/* Allocate data handles and register data to StarPU */
data_handles = malloc(nblocks*sizeof(starpu_data_handle_t *));
for(x = 0; x < nblocks ; x++)
{
  int mpi_rank = my_distrib(x, nodes);
  if (rank == root)
  {
    starpu_vector_data_register(&data_handles[x], STARPU_MAIN_RAM,
    (uintptr_t)vector[x], block_size, sizeof(float));
  }
  else if ((mpi_rank == rank) || ((rank == mpi_rank+1 || rank == mpi_rank-1)))
  {
    /* I own this index, or i will need it for my computations */
    starpu_vector_data_register(&data_handles[x], -1, (uintptr_t)NULL,
    block_size, sizeof(float));
  }
  else
  {
    /* I know it's useless to allocate anything for this */
    data_handles[x] = NULL;
  }
  if (data_handles[x])
  {
    starpu_mpi_data_register(data_handles[x], x*nblocks+y, mpi_rank);
  }
}

/* Scatter the matrix among the nodes */
starpu_mpi_scatter_detached(data_handles, nblocks, root, MPI_COMM_WORLD);

/* Calculation */
for(x = 0; x < nblocks ; x++)
{
  if (data_handles[x])
  {
    int owner = starpu_data_get_rank(data_handles[x]);
    if (owner == rank)
    {
      starpu_task_insert(&cl, STARPU_RW, data_handles[x], 0);
    }
  }
}

/* Gather the matrix on main node */
starpu_mpi_gather_detached(data_handles, nblocks, 0, MPI_COMM_WORLD);

Other collective operations would be easy to define, just ask starpu-devel for them!

17.15 Make StarPU-MPI progression thread execute tasks

The default behaviour of StarPU-MPI is to spawn an MPI thread to take care only of MPI communications in an active fashion (i.e. the StarPU-MPI thread sleeps only when there is no active request submitted by the application), with the goal of being as reactive as possible to communications. Knowing that, users usually leave one free core
17.16 Debugging MPI

Communication trace will be enabled when the environment variable STARPU_MPI_COMM is set to 1, and StarPU has been configured with the option --enable-verbose.

Statistics will be enabled for the communication cache when the environment variable STARPU_MPI_CACHE_STATS is set to 1. It prints messages on the standard output when data are added or removed from the received communication cache.

17.17 More MPI examples

MPI examples are available in the StarPU source code in mpi/examples:

- **comm** shows how to use communicators with StarPU-MPI
- **complex** is a simple example using a user-define data interface over MPI (complex numbers),
- **stencil5** is a simple stencil example using starpu_mpi_task_insert(),
- **matrix_decomposition** is a cholesky decomposition example using starpu_mpi_task_insert(). The non-distributed version can check for algorithm correctness in 1-node configuration, the distributed version uses exactly the same source code, to be used over MPI,
- **mpi_lu** is an LU decomposition example, provided in three versions: plu_example uses explicit MPI data transfers, pluImplicit_example uses implicit MPI data transfers, plu_outofcore_example uses implicit MPI data transfers and supports data matrices which do not fit in memory (out-of-core).

17.18 Notes about the Implementation

StarPU-MPI is implemented directly on top of MPI.

Since the release 1.3.0, an implementation on top of NewMadeleine, an optimizing communication library for high-performance networks, is also provided. To use it, one needs to install NewMadeleine (see \url{http://pm2.gforge.inria.fr/newmadeleine/}) and enable the configure option --enable-nmad.

Both implementations provide the same public API.
17.19  MPI Master Slave Support

StarPU provides an other way to execute applications across many nodes. The Master Slave support permits to use remote cores without thinking about data distribution. This support can be activated with the configure option --enable-mpi-master-slave. However, you should not activate both MPI support and MPI Master-Slave support.

The existing kernels for CPU devices can be used as such. They only have to be exposed through the name of the function in the starpu_codelet::cpu_funcs_name field. Functions have to be globally-visible (i.e. not static) for StarPU to be able to look them up, and -rdynamic must be passed to gcc (or -export-dynamic to ld) so that symbols of the main program are visible. Optionally, you can choose the use of another function on slaves thanks to the field starpu_codelet::mpi_ms_funcs.

By default, one core is dedicated on the master node to manage the entire set of slaves. If the implementation of MPI you are using has a good multiple threads support, you can use the configure option --with-mpi-master-slave-multiple-thread to dedicate one core per slave.

Choosing the number of cores on each slave device is done by setting the environment variable STARPU_NMPI_MSTHREADS=<number> with <number> being the requested number of cores. By default all the slave's cores are used.

Setting the number of slaves nodes is done by changing the -n parameter when executing the application with mpirun or mpiexec.

The master node is by default the node with the MPI rank equal to 0. To select another node, use the environment variable STARPU_MPI_MASTER_NODE=<number> with <number> being the requested MPI rank node.
Chapter 18

FFT Support

StarPU provides libstarpufft, a library whose design is very similar to both fftw and cufft, the difference being that it takes benefit from both CPUs and GPUs. It should however be noted that GPUs do not have the same precision as CPUs, so the results may differ by a negligible amount.

Different precisions are available, namely float, double and long double precisions, with the following fftw naming conventions:

- double precision structures and functions are named e.g. starpufft_execute()
- float precision structures and functions are named e.g. starpufftf_execute()
- long double precision structures and functions are named e.g. starpufftl_execute()

The documentation below is given with names for double precision, replace starpufft_ with starpufftf_ or starpufftl_ as appropriate.

Only complex numbers are supported at the moment.

The application has to call starpu_init() before calling starpufft functions. Either main memory pointers or data handles can be provided.

- To provide main memory pointers, use starpufft_start() or starpufft_execute(). Only one FFT can be performed at a time, because StarPU will have to register the data on the fly. In the starpufft_start() case, starpufft←cleanup() needs to be called to unregister the data.
- To provide data handles (which is preferrable), use starpufft_start_handle() (preferred) or starpufft_execute←_handle(). Several FFTs tasks can be submitted for a given plan, which permits e.g. to start a series of FFT with just one plan. starpufft_start_handle() is preferrable since it does not wait for the task completion, and thus permits to enqueue a series of tasks.

All functions are defined in FFT Support.

18.1 Compilation

The flags required to compile or link against the FFT library are accessible with the following commands:

$ pkg-config --cflags starpufft-1.3  # options for the compiler
$ pkg-config --libs starpufft-1.3   # options for the linker

Also pass the option -static if the application is to be linked statically.
Chapter 19

MIC/SCC Support

19.1 Compilation

SCC support just needs the presence of the RCCE library.
MIC Xeon Phi support actually needs two compilations of StarPU, one for the host and one for the device. The PATH environment variable has to include the path to the cross-compilation toolchain, for instance /usr/linux-k1om-4.7/bin. The SINK_PKG_CONFIG_PATH environment variable should include the path to the cross-compiled hwloc.pc. The script mic-configure can then be used to achieve the two compilations: it basically calls configure as appropriate from two new directories: build_mic and build-_host. make and make install can then be used as usual and will recurse into both directories. If different configuration options are needed for the host and for the mic, one can use --with-host-param=--with-fxt for instance to specify the --with-fxt option for the host only, or --with-mic-param=--with-fxt for the mic only.

One can also run StarPU just natively on the Xeon Phi, i.e. it will only run directly on the Phi without any exchange with the host CPU. The binaries in build_mic can be run that way. For MPI support, you will probably have to specify different MPI compiler path or option for the host and the device builds, for instance:

```
./mic-configure --with-mic-param=--with-mpicc="/.../mpiicc -mmic" \
   --with-host-param=--with-mpicc="/.../mpiicc
```

In case you have troubles with the coi or scif libraries (the Intel paths are really not standard, it seems...), you can still make a build in native mode only, by using mic-configure -enable-native-mic (and notably without -enable-mic since in that case we don’t need mic offloading support).

19.2 Porting Applications To MIC Xeon Phi / SCC

The simplest way to port an application to MIC Xeon Phi or SCC is to set the field starpu_codelet.cpu_funcs_name, to provide StarPU with the function name of the CPU implementation, so for instance:

```c
struct starpu_codelet cl =
{
    .cpu_funcs = {myfunc},
    .cpu_funcs_name = {"myfunc"},
    .nbuffers = 1,
}
```

StarPU will thus simply use the existing CPU implementation (cross-rebuilt in the MIC Xeon Phi case). The functions have to be globally-visible (i.e. not static) for StarPU to be able to look them up, and -rdynamic must be passed to gcc (or -export-dynamic to ld) so that symbols of the main program are visible. If you have used the .where field, you additionally need to add in it STARPU_MIC for the Xeon Phi, and/or STARPU_SCC for the SCC.

For non-native MIC Xeon Phi execution, the ‘main’ function of the application, on the sink, should call starpu_init() immediately upon start-up; the starpu_init() function never returns. On the host, the ‘main’ function may freely perform application related initialization calls as usual, before calling starpu_init().

For MIC Xeon Phi, the application may programmatically detect whether executing on the sink or on the host, by checking whether the STARPU_SINK environment variable is defined (on the sink) or not (on the host).
For SCC execution, the function `starpu_initialize()` also has to be used instead of `starpu_init()`, so as to pass `argc` and `argv`.

### 19.3 Launching Programs

SCC programs are started through RCCE. MIC programs are started from the host. StarPU automatically starts the same program on MIC devices. It however needs to get the MIC-cross-built binary. It will look for the file given by the environment variable `STARPU_MIC_SINK_PROGRAM_NAME` or in the directory given by the environment variable `STARPU_MIC_SINK_PROGRAM_PATH`, or in the field `starpu_conf::mic_sink_program_path`. It will also look in the current directory for the same binary name plus the suffix `-mic` or `_mic`.

The testsuite can be started by simply running `make check` from the top directory. It will recurse into both `build_host` to run tests with only the host, and into `build_mic` to run tests with both the host and the MIC devices. Single tests with the host and the MIC can be run by starting `./loader-cross.sh ./the_test` from `build_mic/tests`. 
Chapter 20

C Extensions

When GCC plug-in support is available, StarPU builds a plug-in for the GNU Compiler Collection (GCC), which defines extensions to languages of the C family (C, C++, Objective-C) that make it easier to write StarPU code. This feature is only available for GCC 4.5 and later; it is known to work with GCC 4.5, 4.6, and 4.7. You may need to install a specific -dev package of your distro, such as gcc-4.6-plugin-dev on Debian and derivatives. In addition, the plug-in's test suite is only run when GNU Guile (http://www.gnu.org/software/guile/) is found at configure-time. Building the GCC plug-in can be disabled by configuring with --disable-gcc-extensions. Those extensions include syntactic sugar for defining tasks and their implementations, invoking a task, and manipulating data buffers. Use of these extensions can be made conditional on the availability of the plug-in, leading to valid C sequential code when the plug-in is not used (Using C Extensions Conditionally).

When StarPU has been installed with its GCC plug-in, programs that use these extensions can be compiled this way:

```
$ gcc -c -fplugin='pkg-config starpu-1.3 --variable=gccplugin' foo.c
```

When the plug-in is not available, the above pkg-config command returns the empty string.

In addition, the -fplugin-arg-starpu-verbose flag can be used to obtain feedback from the compiler as it analyzes the C extensions used in source files.

This section describes the C extensions implemented by StarPU's GCC plug-in. It does not require detailed knowledge of the StarPU library.

Note: this is still an area under development and subject to change.

20.1 Defining Tasks

The StarPU GCC plug-in views tasks as “extended” C functions:

- tasks may have several implementations—e.g., one for CPUs, one written in OpenCL, one written in CUDA;
- tasks may have several implementations of the same target—e.g., several CPU implementations;
- when a task is invoked, it may run in parallel, and StarPU is free to choose any of its implementations.

Tasks and their implementations must be declared. These declarations are annotated with attributes (http://gcc.gnu.org/onlinedocs/gcc/Attribute-Syntax.html#Attribute-Syntax): the declaration of a task is a regular C function declaration with an additional task attribute, and task implementations are declared with a task_implementation attribute.

The following function attributes are provided:

- task Declare the given function as a StarPU task. Its return type must be void. When a function declared as task has a user-defined body, that body is interpreted as the implicit definition of the task's CPU implementation (see example below). In all cases, the actual definition of a task's body is automatically generated by the compiler.

Under the hood, declaring a task leads to the declaration of the corresponding codelet (Codelet and Tasks). If one or more task implementations are declared in the same compilation unit, then the codelet and the function itself are also defined; they inherit the scope of the task.
Scalar arguments to the task are passed by value and copied to the target device if need be—technically, they are passed as the buffer `starpu_task::cl_arg` (Codelet and Tasks).

Pointer arguments are assumed to be registered data buffers—the handles argument of a task (starpu_task::handles); const-qualified pointer arguments are viewed as read-only buffers (STARPU_R), and non-const-qualified buffers are assumed to be used read-write (STARPU_RW). In addition, the output type attribute can be as a type qualifier for output pointer or array parameters (STARPU_W).

`task_implementation (target, task)` Declare the given function as an implementation of `task` to run on `target`. `target` must be a string, currently one of "cpu", "opencl", or "cuda".

Here is an example:

```c
#define __output __attribute__ ((output))
static void matmul (const float *A, const float *B, __output float *C, unsigned nx, unsigned ny, unsigned nz) __attribute__((task));
static void matmul_cpu (const float *A, const float *B, __output float *C, unsigned nx, unsigned ny, unsigned nz) __attribute__((task_implementation ("cpu", matmul)));

static void matmul_cpu (const float *A, const float *B, __output float *C, unsigned nx, unsigned ny, unsigned nz)
{
    unsigned i, j, k;
    for (j = 0; j < ny; j++)
        for (i = 0; i < nx; i++)
            for (k = 0; k < nz; k++)
                C[j * nx + i] += A[j * nz + k] * B[k * nx + i];
}
```

A `matmul` task is defined; it has only one implementation, `matmul_cpu`, which runs on the CPU. Variables `A` and `B` are input buffers, whereas `C` is considered an input/output buffer.

For convenience, when a function declared with the `task` attribute has a user-defined body, that body is assumed to be that of the CPU implementation of a task, which we call an implicit task CPU implementation. Thus, the above snippet can be simplified like this:

```c
#define __output __attribute__ ((output))
static void matmul (const float *A, const float *B, __output float *C, unsigned nx, unsigned ny, unsigned nz) __attribute__((task));
/* Implicit definition of the CPU implementation of the
   'matmul' task. */
static void matmul (const float *A, const float *B, __output float *C, unsigned nx, unsigned ny, unsigned nz)
{
    unsigned i, j, k;
    for (j = 0; j < ny; j++)
        for (i = 0; i < nx; i++)
            for (k = 0; k < nz; k++)
                C[j * nx + i] += A[j * nz + k] * B[k * nx + i];
}
```

Use of implicit CPU task implementations as above has the advantage that the code is valid sequential code when StarPU's GCC plug-in is not used (Using C Extensions Conditionally).

CUDA and OpenCL implementations can be declared in a similar way:

```c
static void matmul_cuda (const float *A, const float *B, float *C, unsigned nx, unsigned ny, unsigned nz) __attribute__((task_implementation ("cuda", matmul)));
static void matmul_opencl (const float *A, const float *B, float *C, unsigned nx, unsigned ny, unsigned nz) __attribute__((task_implementation ("opencl", matmul)));
```

The CUDA and OpenCL implementations typically either invoke a kernel written in CUDA or OpenCL (for similar code, CUDA Kernel, and OpenCL Kernel), or call a library function that uses CUDA or OpenCL under the hood, such as CUBLAS functions.
static void matmul_cuda (const float *A, const float *B, float *C, unsigned nx, unsigned ny, unsigned nz) {
    cublasSgemm ('n', 'n', nx, ny, nz, 1.0f, A, 0, B, 0, 0.0f, C, 0);
    cudaStreamSynchronize (starpu_cuda_get_local_stream ());
}

A task can be invoked like a regular C function:

matmul (&A[i * zdim * bydim + k * bzdim * bydim],
         &B[j * xdim * bzdim + k * xdim *bzdim],
         &C[i * xdim * bydim + j * bxdim * bydim],
         bxdim, bydim, bzdim);

This leads to an asynchronous invocation, whereby matmult’s implementation may run in parallel with the continuation of the caller.

The next section describes how memory buffers must be handled in StarPU-GCC code. For a complete example, see the gcc-plugin/examples directory of the source distribution, and Vector Scaling Using the C Extension.

### 20.2 Initialization, Termination, and Synchronization

The following pragmas allow user code to control StarPU’s life time and to synchronize with tasks.

**#pragma starpu initialize** Initialize StarPU. This call is compulsory and is never added implicitly. One of the reasons this has to be done explicitly is that it provides greater control to user code over its resource usage.

**#pragma starpu shutdown** Shut down StarPU, giving it an opportunity to write profiling info to a file on disk, for instance (Off-line Performance Feedback).

**#pragma starpu wait** Wait for all task invocations to complete, as with starpu_task_wait_for_all().

### 20.3 Registered Data Buffers

Data buffers such as matrices and vectors that are to be passed to tasks must be registered. Registration allows StarPU to handle data transfers among devices—e.g., transferring an input buffer from the CPU’s main memory to a task scheduled to run a GPU (StarPU Data Management Library).

The following pragmas are provided:

**#pragma starpu register ptr [size]** Register ptr as a size-element buffer. When ptr has an array type whose size is known, size may be omitted. Alternatively, the registered attribute can be used (see below.)

**#pragma starpu unregister ptr** Unregister the previously-registered memory area pointed to by ptr. As a side-effect, ptr points to a valid copy in main memory.

**#pragma starpu acquire ptr** Acquire in main memory an up-to-date copy of the previously-registered memory area pointed to by ptr, for read-write access.

**#pragma starpu release ptr** Release the previously-register memory area pointed to by ptr, making it available to the tasks.

Additionally, the following attributes offer a simple way to allocate and register storage for arrays:

**registered** This attributes applies to local variables with an array type. Its effect is to automatically register the array’s storage, as per #pragma starpu register. The array is automatically unregistered when the variable’s scope is left. This attribute is typically used in conjunction with the heap_allocated attribute, described below.

**heap_allocated** This attributes applies to local variables with an array type. Its effect is to automatically allocate the array’s storage on the heap, using starpu_malloc() under the hood. The heap-allocated array is automatically freed when the variable’s scope is left, as with automatic variables.

The following example illustrates use of the heap_allocated attribute:
extern void cholesky(unsigned nblocks, unsigned size, 
    float mat[nblocks][nblocks][size] 
    __attribute__((task));

int main (int argc, char *argv[])
{
    #pragma starpu initialize
    /* ...
    
    int nblocks, size;
    parse_args (&nblocks, &size);
    /* Allocate an array of the required size on the heap, 
    and register it. */
    {
        float matrix[nblocks][nblocks][size] 
        __attribute__((heap_allocated, registered));
        cholesky (nblocks, size, matrix);
    }
    #pragma starpu wait
    } /* MATRIX is automatically unregistered & freed here. */
    #pragma starpu shutdown
    return EXIT_SUCCESS;
}

20.4 Using C Extensions Conditionally

The C extensions described in this chapter are only available when GCC and its StarPU plug-in are in use. Yet, it is possible to make use of these extensions when they are available—leading to hybrid CPU/GPU code—and discard them when they are not available—leading to valid sequential code.

To that end, the GCC plug-in defines the C preprocessor macro — STARPU_GCC_PLUGIN — when it is being used. When defined, this macro expands to an integer denoting the version of the supported C extensions.

The code below illustrates how to define a task and its implementations in a way that allows it to be compiled without the GCC plug-in:

    /* This program is valid, whether or not StarPU’s GCC plug-in 
    is being used. */
    
#define STARPU_GCC_PLUGIN

    /************************************************************************
    */
    static void matmul (const float *A, const float *B, float * C, 
                     unsigned nx, unsigned ny, unsigned nz) 
    __attribute__((task));
    static void matmul (const float *A, const float *B, float * C, 
                     unsigned nx, unsigned ny, unsigned nz) 
    {
        /* Code of the CPU kernel here... */
    }
    
    #ifdef STARPU_GCC_PLUGIN
    /************************************************************************
    */
    static void matmul_opencl (const float *A, const float *B, float * C, 
                             unsigned nx, unsigned ny, unsigned nz) 
    __attribute__((task_implementation("opencl", matmul)));
    static void matmul_opencl (const float *A, const float *B, float * C, 
                             unsigned nx, unsigned ny, unsigned nz) 
    {
        /* Code that invokes the OpenCL kernel here... */
    }
    #endif
}

int main (int argc, char *argv[])
{
    /* The pragmas below are simply ignored when StarPU-GCC 
    is not used. */
    #pragma starpu initialize
    
    /************************************************************************
    */
    #include <stdlib.h>
    /************************************************************************
    */
    static void matmul (const float *A, const float *B, float * C, 
                     unsigned nx, unsigned ny, unsigned nz) 
    __attribute__((task));
    static void matmul (const float *A, const float *B, float * C, 
                     unsigned nx, unsigned ny, unsigned nz) 
    {
        /* Code of the CPU kernel here... */
    }
    
    #ifdef STARPU_GCC_PLUGIN
    /************************************************************************
    */
    static void matmul_opencl (const float *A, const float *B, float * C, 
                             unsigned nx, unsigned ny, unsigned nz) 
    __attribute__((task_implementation("opencl", matmul)));
    static void matmul_opencl (const float *A, const float *B, float * C, 
                             unsigned nx, unsigned ny, unsigned nz) 
    {
        /* Code that invokes the OpenCL kernel here... */
    }
    #endif
}

int main (int argc, char *argv[])
{
    /* The pragmas below are simply ignored when StarPU-GCC 
    is not used. */
    #pragma starpu initialize

#pragma starpu register A
#pragma starpu register B
#pragma starpu register C

/* When StarPU-GCC is used, the call below is asynchronous;
otherwise, it is synchronous. */
matmul ((float *) A, (float *) B, (float *) C, 123, 42, 7);

#pragma starpu wait
#pragma starpu shutdown

return EXIT_SUCCESS;
}

The above program is a valid StarPU program when StarPU’s GCC plug-in is used; it is also a valid sequential
program when the plug-in is not used.

Note that attributes such as task as well as starpu pragmas are simply ignored by GCC when the StarPU plug-in is not loaded. However, gcc -Wall emits a warning for unknown attributes and pragmas, which can be inconvenient. In addition, other compilers may be unable to parse the attribute syntax (In practice, Clang and several proprietary compilers implement attributes.), so you may want to wrap attributes in macros like this:

/* Use the ‘task’ attribute only when StarPU’s GCC plug-in
is available. */
#ifdef STARPU_GCC_PLUGIN
#define __task __attribute__((task))
#else
#define __task
#endif

static void matmul (const float *A, const float *B, float *C, unsigned nx, unsigned ny, unsigned nz) __task ;
Chapter 21

Native Fortran Support

StarPU provides the necessary routines and support to natively access most of its functionalities from Fortran 2008+ codes. All symbols (functions, constants) are defined in fstarpu_mod.f90. Every symbol of the Native Fortran support API is prefixed by fstarpu_.

Note: Mixing uses of fstarpu_ and starpu_ symbols in the same Fortran code has unspecified behaviour. See Valid API Mixes and Language Mixes for a discussion about valid and unspecified combinations.

21.1 Implementation Details and Specificities

21.1.1 Prerequisites

The Native Fortran support relies on Fortran 2008 specific constructs, as well as on the support of interoperability of assumed-shape arrays introduced as part of Fortran’s Technical Specification ISO/IEC TS 29113:2012, for which no equivalent are available in previous versions of the standard. It has currently been tested successfully with GNU GFortran 4.9, GFortran 5.x, GFortran 6.x and the Intel Fortran Compiler >= 2016. It is known not to work with GNU GFortran < 4.9, Intel Fortran Compiler < 2016.

See Section Using StarPU with Older Fortran Compilers on information on how to write StarPU Fortran code with older compilers.

21.1.2 Configuration

The Native Fortran API is enabled and its companion fstarpu_mod.f90 Fortran module source file is installed by default when a Fortran compiler is found, unless the detected Fortran compiler is known not to support the requirements for the Native Fortran API. The support can be disabled through the configure option --disable-fortran.

Conditional compiled source codes may check for the availability of the Native Fortran Support by testing whether the preprocessor macro STARPU_HAVE_FC is defined or not.

21.1.3 Examples

Several examples using the Native Fortran API are provided in StarPU's examples/native_fortran/ examples directory, to showcase the Fortran flavor of various basic and more advanced StarPU features.

21.1.4 Compiling a Native Fortran Application

The Fortran module fstarpu_mod.f90 installed in StarPU's include/ directory provides all the necessary API definitions. It must be compiled with the same compiler (same vendor, same version) as the application itself, and the resulting fstarpu_mod.o object file must linked with the application executable.

Each example provided in StarPU's examples/native_fortran/ examples directory comes with its own dedicated Makefile for out-of-tree build. Such example Makefiles may be used as starting points for building application codes with StarPU.
21.2 Fortran Translation for Common StarPU API Idioms

All these examples assume that the standard Fortran module `iso_c_binding` is in use.

- **Specifying a NULL pointer**

```fortran
  type(c_ptr) :: my_ptr  ! variable to store the pointer
  my_ptr = c_null_ptr  ! assign standard constant for null ptr
```

- **Obtaining a pointer to some object**

```fortran
  real(8), dimension(:), allocatable, target :: va
  type(c_ptr) :: p_va  ! variable to store a pointer to array va
  p_va = c_loc(va)
```

- **Obtaining a pointer to some subroutine**

```fortran
  ! pointed routine definition
  recursive subroutine myfunc () bind(C)
  ! ...
  type(c_funptr) :: p_fun  ! variable to store the routine pointer
  ! ...
  p_fun = c_funloc(my_func)
```

- **Obtaining the size of some object**

```fortran
  real(8) :: a
  integer(c_size_t) :: sz_a  ! variable to store the size of a
  sz_a = c_sizeof(a)
```

- **Obtaining the length of an array dimension**

```fortran
  real(8), dimension(:,:), allocatable, target :: vb
  integer(c_int) :: ln_vb_1  ! variable to store the length of vb’s dimension 1
  integer(c_int) :: ln_vb_2  ! variable to store the length of vb’s dimension 2
  ln_vb_1 = 1+ubound(vb,1)-lbound(vb,1)  ! get length of dimension 1 of vb
  ln_vb_2 = 1+ubound(vb,2)-lbound(vb,2)  ! get length of dimension 2 of vb
```

- **Specifying a string constant**

```fortran
  type(c_ptr) :: my_cl  ! a StarPU codelet
  ! set the name of a codelet to string 'my_codelet':
  call fstarpu_codelet_set_name(my_cl, c_char_"my_codelet"//c_null_char)
  ! note: using the C_CHAR prefix and the //C_NULL_CHAR concatenation at the end ensures
  ! that the string constant is properly \0 terminated, and compatible with StarPU's
  ! internal C routines
  ! note: plain Fortran string constants are not \0 terminated, and as such, must not be
  ! passed to starpu routines.
```

- **Combining multiple flag constants with a bitwise 'or'**

```fortran
  type(c_ptr) :: my_cl  ! a pointer for the codelet structure
  ! add a managed buffer to a codelet, specifying both the Read/Write access mode and the Locality hint
  call fstarpu_codelet_add_buffer(my_cl, fstarpu_rw.ior.fstarpu_locality)
```
21.3 Uses, Initialization and Shutdown

The snippet below show an example of minimal StarPU code using the Native Fortran support. The program should use the standard module iso_c_binding as well as StarPU's fstarpu_mod. The StarPU runtime engine is initialized with a call to function fstarpu_init, which returns an integer status of 0 if successful or non-0 otherwise. Eventually, a call to fstarpu_shutdown ends the runtime engine and frees all internal StarPU data structures.

```fortran
program nf_initexit
    use iso_c_binding ! C interfacing module
    use fstarpu_mod ! StarPU interfacing module
    implicit none ! Fortran recommended best practice
    integer(c_int) :: err ! return status for fstarpu_init
    ! initialize StarPU with default settings
    err = fstarpu_init(c_null_ptr)
    if (err /= 0) then
        stop 1 ! StarPU initialization failure
    end if
    ! - add StarPU Native Fortran API calls here
    ! shut StarPU down
    call fstarpu_shutdown()
end program nf_initexit
```

21.4 Fortran Flavor of StarPU's Variadic Insert_task

Fortran does not have a construction similar to C variadic functions on which starpu_insert_task relies at the time of this writing. However, Fortran's variable length arrays of c_ptr elements enable to emulate much of the convenience of C's variadic functions. This is the approach retained for implementing fstarpu_insert_task. The general syntax for using fstarpu_insert_task is as follows:

```fortran
call fstarpu_insert_task((/ <codelet ptr> &
                         , <access mode flags>, <data handle>)* &
                         , <argument type constant>, <argument>)* &
                         , c_null_ptr /))
```

There is thus a unique array argument (/ ... /) passed to fstarpu_insert_task which itself contains the task settings. Each element of the array must be of type type(c_ptr). The last element of the array must be C_NULL_PTR.

Example extracted from nf_vector.f90:

```fortran
call fstarpu_insert_task((/ cl_vec, & ! codelet
                         fstarpu_r, dh_va, & ! a first data handle
                         fstarpu_rw.ior.fstarpu_locality, dh_vb, & ! a second data handle
                         c_null_ptr /)) ! no more args
```

21.5 Functions and Subroutines Expecting Data Structures Arguments

Several StarPU structures that are expected to be passed to the C API, are replaced by function/subroutine wrapper sets to allocate, set fields and free such structure. This strategy has been preferred over defining native Fortran equivalent of such structures using Fortran's derived types, to avoid potential layout mismatch between C and Fortran StarPU data structures. Examples of such data structures wrappers include fstarpu_conf_allocate and alike, fstarpu_codelet_allocate and alike, fstarpu_data_filter_allocate and alike.

Here is an example of allocating, filling and deallocating a codelet structure:

```fortran
! a pointer for the codelet structure
type(c_ptr) :: cl_vec
! [...] ! allocate an empty codelet structure
cl_vec = fstarpu_codelet_allocate() ! add a CPU implementation function to the codelet
call fstarpu_codelet_add_cpu_func(cl_vec, c_funloc(cl_cpu_func_vec))
! set the codelet name
call fstarpu_codelet_set_name(cl_vec, c_char_"my_vec_codelet"//c_null_char)
! add a Read-only mode data buffer to the codelet
call fstarpu_codelet_add_buffer(cl_vec, fstarpu_r)
! [...] ! free codelet structure
call fstarpu_codelet_free(cl_vec)
```
21.6 Additional Notes about the Native Fortran Support

21.6.1 Using StarPU with Older Fortran Compilers

When using older compilers, Fortran applications may still interoperate with StarPU using C marshalling functions as exemplified in StarPU’s examples/fortran/ and examples/fortran90/ example directories, though the process will be less convenient. Basically, the main FORTRAN code calls some C wrapper functions to submit tasks to StarPU. Then, when StarPU starts a task, another C wrapper function calls the FORTRAN routine for the task. Note that this marshalled FORTRAN support remains available even when specifying configure option --disable-fortran (which only disables StarPU's native Fortran layer).

21.6.2 Valid API Mixes and Language Mixes

Mixing uses of fstarpu_ and starpu_symbols in the same Fortran code has unspecified behaviour. Using fstarpu_symbols in C code has unspecified behaviour. For multi-language applications using both C and Fortran source files:

- C source files must use starpu_symbols exclusively
- Fortran sources must uniformly use either fstarpu_symbols exclusively, or starpu_symbols exclusively. Every other combination has unspecified behaviour.
Chapter 22

SOCL OpenCL Extensions

SOCL is an OpenCL implementation based on StarPU. It gives a unified access to every available OpenCL device: applications can now share entities such as Events, Contexts or Command Queues between several OpenCL implementations.

In addition, command queues that are created without specifying a device provide automatic scheduling of the submitted commands on OpenCL devices contained in the context to which the command queue is attached. Setting the `CL_QUEUE_OUT_OF_ORDER_EXEC_MODE_ENABLE` flag on a command queue also allows StarPU to reorder kernels queued on the queue, otherwise they would be serialized and several command queues would be necessary to see kernels dispatched on the various OpenCL devices.

Note: this is still an area under development and subject to change.

When compiling StarPU, SOCL will be enabled if a valid OpenCL implementation is found on your system. To be able to run the SOCL test suite, the environment variable `SOCL_OCL_LIB_OPENCL` needs to be defined to the location of the file `libOpenCL.so` of the OCL ICD implementation. You should for example add the following line in your file `.bashrc`:

```bash
export SOCL_OCL_LIB_OPENCL=/usr/lib/x86_64-linux-gnu/libOpenCL.so
```

You can then run the test suite in the directory `socl/examples`.

```bash
$ make check
... PASS: basic/basic PASS: testmap/testmap PASS: clinfo/clinfo PASS: matmul/matmul PASS: mansched/mansched ================ All 5 tests passed ================
```

The environment variable `OCL_ICD_VENDORS` has to point to the directory where the socl.icd ICD file is installed. When compiling StarPU, the files are in the directory `socl/vendors`. With an installed version of StarPU, the files are installed in the directory `$prefix/share/starpu/opencl/vendors`.

To run the tests by hand, you have to call for example,

```bash
$ LD_PRELOAD=$SOCL_OCL_LIB_OPENCL OCL_ICD_VENDORS=socl/vendors/ socl/examples/clinfo/clinfo
```

To enable the use of CPU cores via OpenCL, one can set the `STARPU_OPNCL_ON_CPUS` environment variable to 1 and `STARPU_NCPUS` to 0 (to avoid using CPUs both via the OpenCL driver and the normal CPU driver).
Chapter 23

SimGrid Support

StarPU can use Simgrid in order to simulate execution on an arbitrary platform. This was tested with simgrid from 3.11 to 3.16, and 3.18 to 3.20. Other versions may have compatibility issues. 3.17 notably does not build at all.

23.1 Preparing Your Application For Simulation

There are a few technical details which need to be handled for an application to be simulated through Simgrid. If the application uses gettimeofday to make its performance measurements, the real time will be used, which will be bogus. To get the simulated time, it has to use starpu_timing_now() which returns the virtual timestamp in us.

For some technical reason, the application's .c file which contains main() has to be recompiled with starpu_simgrid_wrap.h, which in the simgrid case will # define main() into starpu_main(), and it is libstarpu which will provide the real main() and will call the application's main().

To be able to test with crazy data sizes, one may want to only allocate application data if STARPU_SIMGRID is not defined. Passing a NULL pointer to starpu_data_register functions is fine, data will never be read/written to by StarPU in Simgrid mode anyway.

To be able to run the application with e.g. CUDA simulation on a system which does not have CUDA installed, one can fill the cuda_funcs with (void*)1, to express that there is a CUDA implementation, even if one does not actually provide it. StarPU will not actually run it in Simgrid mode anyway (unless the STARPU_CODELET_SIMGRID_EXECUTE or STARPU_CODELET_SIMGRID_EXECUTE_AND_INJECT flags are set in the codelet).

```
static struct starpu_codelet cl11 =
{
    .cpu_funcs = {chol_cpu_codelet_update_u11},
    .cpu_funcs_name = {"chol_cpu_codelet_update_u11"},
#ifdef STARPU_USE_CUDA
    .cuda_funcs = {chol_cublas_codelet_update_u11},
#else defined(STARPU_SIMGRID)
    .cuda_funcs = { (void*)1 },
#endif
    .nbuffers = 1,
    .modes = {STARPU_RW},
    .model = &chol_model_11
};
```

23.2 Calibration

The idea is to first compile StarPU normally, and run the application, so as to automatically benchmark the bus and the codelets.

```
$ ./configure && make
$ STARPU_SCHED=dmda ./examples/matvecmult/matvecmult
[starpu][starpu_load_history_based_model] Warning: model matvecmult is not calibrated, forcing calibration for this run. Use the STARPU_CALIBRATE environment variable to control this.
$ ...
$ STARPU_SCHED=dmda ./examples/matvecmult/matvecmult
TEST PASSED
```
Note that we force to use the scheduler `dmda` to generate performance models for the application. The application may need to be run several times before the model is calibrated.

### 23.3 Simulation

Then, recompile StarPU, passing `--enable-simgrid` to `./configure`. Make sure to keep all other `./configure` options the same, and notably options such as `--enable-maxcudadev`.

```bash
$ ./configure --enable-simgrid
```

To specify the location of SimGrid, you can either set the environment variables `SIMGRID_CFLAGS` and `SIMGRID_LIBS`, or use the configure options `--with-simgrid-dir`, `--with-simgrid-include-dir` and `--with-simgrid-lib-dir`, for example

```bash
$ ./configure --with-simgrid-dir=/opt/local/simgrid
```

You can then re-run the application.

```bash
$ make
$ STARPU_SCHED=dmda ./examples/matvecmult/matvecmult
TEST FAILED !!!
```

It is normal that the test fails: since the computation are not actually done (that is the whole point of simgrid), the result is wrong, of course.

If the performance model is not calibrated enough, the following error message will be displayed

```bash
$ STARPU_SCHED=dmda ./examples/matvecmult/matvecmult
[starpu][_starpu_load_history_based_model] Warning: model matvecmult is not calibrated, forcing calibration for this run. Use the STARPU_CALIBRATE environment variable to control this.
[starpu][_starpu_simgrid_execute_job][assert failure] Codelet matvecmult does not have a perfmodel, or is not calibrated enough
```

The number of devices can be chosen as usual with `STARPU_NCPU`, `STARPU_NCUDA`, and `STARPU_NOPECL`, and the amount of GPU memory with `STARPU_LIMIT_CUDA_MEM`, `STARPU_LIMIT_CUDA_devid_MEM`, `STARPU_LIMIT_OPENCL_MEM`, and `STARPU_LIMIT_OPENCL_devid_MEM`.

### 23.4 Simulation On Another Machine

The simgrid support even permits to perform simulations on another machine, your desktop, typically. To achieve this, one still needs to perform the Calibration step on the actual machine to be simulated, then copy them to your desktop machine (the `$STARPU_HOME/.starpu` directory). One can then perform the Simulation step on the desktop machine, by setting the environment variable `STARPU_HOSTNAME` to the name of the actual machine, to make StarPU use the performance models of the simulated machine even on the desktop machine. If the desktop machine does not have CUDA or OpenCL, StarPU is still able to use simgrid to simulate execution with CUDA/OpenCL devices, but the application source code will probably disable the CUDA and OpenCL codelets in that case. Since during simgrid execution, the functions of the codelet are actually not called by default, one can use dummy functions such as the following to still permit CUDA or OpenCL execution.

### 23.5 Simulation Examples

StarPU ships a few performance models for a couple of systems: attila, mirage, idgraf, and sirocco. See section Simulated benchmarks for the details.

### 23.6 Simulations On Fake Machines

It is possible to build fake machines which do not exist, by modifying the platform file in `$STARPU_HOME/.starpu/sampling/bus/machine.platform.xml` by hand: one can add more CPUs, add GPUs (but the performance model file has to be extended as well), change the available GPU memory size, PCI memory bandwidth, etc.
23.7 Tweaking Simulation

The simulation can be tweaked, to be able to tune it between a very accurate simulation and a very simple simulation (which is thus close to scheduling theory results), see the STARPU_SIMGRID_CUDA_MALLOC_COST, STARPU_SIMGRID_CUDA_QUEUE_COST, STARPU_SIMGRID_TASK_SUBMIT_COST, STARPU_SIMGRID_FETCHING_INPUT_COST and STARPU_SIMGRID_SCHED_COST environment variables.

23.8 MPI Applications

StarPU-MPI applications can also be run in simgrid mode. It needs to be compiled with smpicc, and run using the starpu_smpirun script, for instance:

```
$ STARPU_SCHED=dmda starpu_smpirun -platform cluster.xml -hostfile hostfile ./mpi/tests/pingpong
```

Where cluster.xml is a Simgrid-MPI platform description, and hostfile the list of MPI nodes to be used. StarPU currently only supports homogeneous MPI clusters: for each MPI node it will just replicate the architecture referred by STARPU_HOSTNAME.

23.9 Debugging Applications

By default, simgrid uses its own implementation of threads, which prevents gdb from being able to inspect stacks of all threads. To be able to fully debug an application running with simgrid, pass the `-cfg=contexts/factory=thread` option to the application, to make simgrid use system threads, which gdb will be able to manipulate as usual.

It is also worth noting Simgrid 3.21’s new parameter `-cfg=simix/breakpoint` which allows to put a breakpoint at a precise (deterministic!) timing of the execution. If for instance in an execution trace we see that something odd is happening at time 19000ms, we can use `-cfg=simix/breakpoint:19.000` and SIGTRAP will be raised at that point, which will thus interrupt execution within gdb, allowing to inspect e.g. scheduler state, etc.

23.10 Memory Usage

Since kernels are not actually run and data transfers are not actually performed, the data memory does not actually need to be allocated. This allows for instance to simulate the execution of applications processing very big data on a small laptop.

The application can for instance pass 1 (or whatever bogus pointer) to starpu data registration functions, instead of allocating data. This will however require the application to take care of not trying to access the data, and will not work in MPI mode, which performs transfers.

Another way is to pass the STARPU_MALLOC_SIMULATION_FOLDED flag to the starpu_malloc_flags() function. This will make it allocate a memory area which one can read/write, but optimized so that this does not actually consume memory. Of course, the values read from such area will be bogus, but this allows the application to keep e.g. data load, store, initialization as it is, and also work in MPI mode.

Note however that notably Linux kernels refuse obvious memory overcommitting by default, so a single allocation can typically not be bigger than the amount of physical memory, see `https://www.kernel.org/doc/Documentation/vm/overcommit-accounting` This prevents for instance from allocating a single huge matrix. Allocating a huge matrix in several tiles is not a problem, however. `sysctl vm.overcommit_memory=1` can also be used to allow such overcommit.

Note however that this folding is done by remapping the same file several times, and Linux kernels will also refuse to create too many memory areas. `sysctl vm.max_map_count` can be used to check and change the default (65535). By default, StarPU uses a 1MiB file, so it hopefully fits in the CPU cache. This however limits the amount of such folded memory to a bit below 64GiB. The STARPU_MALLOC_SIMULATION_FOLD environment variable can be used to increase the size of the file.
Chapter 24

OpenMP Runtime Support

StarPU provides the necessary routines and support to implement an OpenMP (http://www.openmp.org/) runtime compliant with the revision 3.1 of the language specification, and compliant with the task-related data dependency functionalities introduced in the revision 4.0 of the language. This StarPU OpenMP Runtime Support (SORS) has been designed to be targetted by OpenMP compilers such as the Klang-OMP compiler. Most supported OpenMP directives can both be implemented inline or as outlined functions. All functions are defined in OpenMP Runtime Support.

24.1 Implementation Details and Specificities

24.1.1 Main Thread

When using the SORS, the main thread gets involved in executing OpenMP tasks just like every other threads, in order to be compliant with the specification execution model. This contrasts with StarPU's usual execution model where the main thread submit tasks but does not take part in executing them.

24.1.2 Extended Task Semantics

The semantics of tasks generated by the SORS are extended with respect to regular StarPU tasks in that SORS' tasks may block and be preempted by SORS call, whereas regular StarPU tasks cannot. SORS tasks may coexist with regular StarPU tasks. However, only the tasks created using SORS API functions inherit from extended semantics.

24.2 Configuration

The SORS can be compiled into libstarpu through the configure option --enable-openmp. Conditional compiled source codes may check for the availability of the OpenMP Runtime Support by testing whether the C preprocessor macro STARPU_OPENMP is defined or not.

24.3 Uses, Initialization and Shutdown

The SORS needs to be executed/terminated by the starpu_omp_init() / starpu_omp_shutdown() instead of starpu___init() / starpu_shutdown(). This requirement is necessary to make sure that the main thread gets the proper execution environment to run OpenMP tasks. These calls will usually be performed by a compiler runtime. Thus, they can be executed from a constructor/destructor such as this:

```c
__attribute__((constructor))
static void omp_constructor(void)
{
    int ret = starpu_omp_init();
    STARPU_CHECK_RETURN_VALUE(ret, "starpu_omp_init");
}
__attribute__((destructor))
static void omp_destructor(void)
{
```

OpenMP Runtime Support

24.4 Parallel Regions and Worksharing

The SORS provides functions to create OpenMP parallel regions as well as mapping work on participating workers. The current implementation does not provide nested active parallel regions: Parallel regions may be created recursively, however only the first level parallel region may have more than one worker. From an internal point-of-view, the SORS’ parallel regions are implemented as a set of implicit, extended semantics StarPU tasks, following the execution model of the OpenMP specification. Thus the SORS’ parallel region tasks may block and be preempted, by SORS calls, enabling constructs such as barriers.

24.4.1 Parallel Regions

Parallel regions can be created with the function `starpu_omp_parallel_region()` which accepts a set of attributes as parameter. The execution of the calling task is suspended until the parallel region completes. The field `starpu_omp_parallel_region_attr::cl` is a regular StarPU codelet. However only CPU codelets are supported for parallel regions. Here is an example of use:

```c
void parallel_region_f(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    pthread_t tid = pthread_self();
    int worker_id = starpu_worker_get_id();
    printf("[tid %p] task thread = %d\n", (void *)tid, worker_id);
}

void f(void)
{
    struct starpu_omp_parallel_region_attr attr;
    memset(&attr, 0, sizeof(attr));
    attr.cl.cpu_funcs[0] = parallel_region_f;
    attr.cl.where = STARPU_CPU;
    attr.if_clause = 1;
    starpu_omp_parallel_region(&attr);
    return 0;
}
```

- `starpu_omp_parallel_region()`

24.4.2 Parallel For

OpenMP for loops are provided by the `starpu_omp_for()` group of functions. Variants are available for inline or outlined implementations. The SORS supports static, dynamic, and guided loop scheduling clauses. The auto scheduling clause is implemented as static. The runtime scheduling clause honors the scheduling mode selected through the environment variable OMP_SCHEDULE or the `starpu_omp_set_schedule()` function.

For loops with the ordered clause are also supported. An implicit barrier can be enforced or skipped at the end of the worksharing construct, according to the value of the nowait parameter.

The canonical family of `starpu_omp_for()` functions provide each instance with the first iteration number and the number of iterations (possibly zero) to perform. The alternate family of `starpu_omp_for_alt()` functions provide each instance with the (possibly empty) range of iterations to perform, including the first and excluding the last.

The family of `starpu_omp_ordered()` functions enable to implement OpenMP’s ordered construct, a region with a parallel for loop that is guaranteed to be executed in the sequential order of the loop iterations.

```c
void for_g(unsigned long long i, unsigned long long nb_i, void *arg)
{
    (void) arg;
}
for (; nb_i > 0; i++, nb_i--)
    array[i] = 1;
}

void parallel_region_f(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    starpu_omp_for(for_g, NULL, NB_ITERS, CHUNK, starpu_omp_sched_static, 0, 0);
}

starpu_omp_ordered()
starpu_omp_ordered_inline_begin()
starpu_omp_ordered_inline_end()

24.4.3 Sections

OpenMP sections worksharing constructs are supported using the set of starpu_omp_sections() variants. The
general principle is either to provide an array of per-section functions or a single function that will redirect to execution
to the suitable per-section functions. An implicit barrier can be enforced or skipped at the end of the worksharing
construct, according to the value of the nowait parameter.

void parallel_region_f(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    section_funcs[0] = f;
    section_funcs[1] = g;
    section_funcs[2] = h;
    section_funcs[3] = i;
    section_args[0] = arg_f;
    section_args[1] = arg_g;
    section_args[2] = arg_h;
    section_args[3] = arg_i;
    starpu_omp_sections(4, section_f, section_args, 0);
}

See also
starpu_omp_sections()
starpu_omp_sections_combined()

24.4.4 Single

OpenMP single worksharing constructs are supported using the set of starpu_omp_single() variants. An implicit
barrier can be enforced or skipped at the end of the worksharing construct, according to the value of the nowait parameter.

void single_f(void *arg)
{
    (void) arg;
    pthread_t tid = pthread_self();
    int worker_id = starpu_worker_get_id();
    printf("[tid %p] task thread = %d -- single\n", (void *)&tid, worker_id);
}

void parallel_region_f(void *buffers[], void *args)
{
    (void) buffers;
The SORS also provides dedicated support for single sections with copyprivate clauses through the `starpu_omp_single_copyprivate()` function variants. The OpenMP master directive is supported as well using the `starpu_omp_master()` function variants.

### 24.5 Tasks

The SORS implements the necessary support of OpenMP 3.1 and OpenMP 4.0's so-called explicit tasks, together with OpenMP 4.0's data dependency management.

#### 24.5.1 Explicit Tasks

Explicit OpenMP tasks are created with the SORS using the `starpu_omp_task_region()` function. The implementation supports if, final, untied and mergeable clauses as defined in the OpenMP specification. Unless specified otherwise by the appropriate clause(s), the created task may be executed by any participating worker of the current parallel region.

The current SORS implementation requires explicit tasks to be created within the context of an active parallel region. In particular, an explicit task cannot be created by the main thread outside of a parallel region. Explicit OpenMP tasks created using `starpu_omp_task_region()` are implemented as StarPU tasks with extended semantics, and may as such be blocked and preempted by SORS routines.

The current SORS implementation supports recursive explicit tasks creation, to ensure compliance with the OpenMP specification. However, it should be noted that StarPU is not designed nor optimized for efficiently scheduling of recursive task applications.

The code below shows how to create 4 explicit tasks within a parallel region.

```c
void task_region_g(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    pthread tid = pthread_self();
    int worker_id = starpu_worker_get_id();
    printf("[tid %p] task thread = %d: explicit task\n", (void *)tid, worker_id);
}

void parallel_region_f(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    struct starpu_omp_task_region_attr attr;
    memset(&attr, 0, sizeof(attr));
    attr.cl.cpu_funcs[0] = task_region_g;
    attr.cl.where = STARPU_CPU;
    attr.if_clause = 1;
    attr.final_clause = 0;
    attr.untied_clause = 1;
    attr.mergeable_clause = 0;
    starpu_omp_task_region(&attr);
    starpu_omp_task_region(&attr);
    starpu_omp_task_region(&attr);
    starpu_omp_task_region(&attr);
}
```

- `struct starpu_omp_task_region_attr`
- `starpu_omp_task_region()`
24.5 Tasks

24.5.2 Data Dependencies

The SORS implements inter-tasks data dependencies as specified in OpenMP 4.0. Data dependencies are expressed using regular StarPU data handles (starpu_data_handle_t) plugged into the task's attr.cl codelet. The family of starpu_vector_data_register() -like functions and the starpu_data_lookup() function may be used to register a memory area and to retrieve the current data handle associated with a pointer respectively. The testcase ./tests/openmp/task_02.c gives a detailed example of using OpenMP 4.0 tasks dependencies with the SORS implementation.

Note: the OpenMP 4.0 specification only supports data dependencies between sibling tasks, that is tasks created by the same implicit or explicit parent task. The current SORS implementation also only supports data dependencies between sibling tasks. Consequently the behaviour is unspecified if dependencies are expressed between tasks that have not been created by the same parent task.

24.5.3 TaskWait and TaskGroup

The SORS implements both the taskwait and taskgroup OpenMP task synchronization constructs specified in OpenMP 4.0, with the starpu_omp_taskwait() and starpu_omp_taskgroup() functions respectively.

An example of starpu_omp_taskwait() use, creating two explicit tasks and waiting for their completion:

```c
void task_region_g(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    printf("Hello, World!\n");
}

void parallel_region_f(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    struct starpu_omp_task_region_attr attr;
    memset(&attr, 0, sizeof(attr));
    attr.cl.cpu_funcs[0] = task_region_g;
    attr.cl.where = STARPU_CPU;
    attr.if_clause = 1;
    attr.final_clause = 0;
    attr.untied_clause = 1;
    attr.mergeable_clause = 0;
    starpu_omp_task_region(&attr);
    starpu_omp_task_region(&attr);
    starpu_omp_taskwait();
}
```

An example of starpu_omp_taskgroup() use, creating a task group of two explicit tasks:

```c
void task_region_g(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    printf("Hello, World!\n");
}

void taskgroup_f(void *arg)
{
    (void)arg;
    struct starpu_omp_task_region_attr attr;
    memset(&attr, 0, sizeof(attr));
    attr.cl.cpu_funcs[0] = task_region_g;
    attr.cl.where = STARPU_CPU;
    attr.if_clause = 1;
    attr.final_clause = 0;
    attr.untied_clause = 1;
    attr.mergeable_clause = 0;
    starpu_omp_task_region(&attr);
    starpu_omp_task_region(&attr);
}
```

```c
void parallel_region_f(void *buffers[], void *args)
{
    (void) buffers;
    (void) args;
    starpu_omp_taskgroup(taskgroup_f, (void *)NULL);
}
```
24.6 Synchronization Support

The SORS implements objects and method to build common OpenMP synchronization constructs.

24.6.1 Simple Locks

The SORS Simple Locks are opaque starpu_omp_lock_t objects enabling multiple tasks to synchronize with each others, following the Simple Lock constructs defined by the OpenMP specification. In accordance with such specification, simple locks may not by acquired multiple times by the same task, without being released in-between; otherwise, deadlocks may result. Codes requiring the possibility to lock multiple times recursively should use Nestable Locks (Nestable Locks). Codes NOT requiring the possibility to lock multiple times recursively should use Simple Locks as they incur less processing overhead than Nestable Locks.

See also

starpu_omp_lock_t
starpu_omp_init_lock()
starpu_omp_destroy_lock()
starpu_omp_set_lock()
starpu_omp_unset_lock()
starpu_omp_test_lock()

24.6.2 Nestable Locks

The SORS Nestable Locks are opaque starpu_omp_nest_lock_t objects enabling multiple tasks to synchronize with each others, following the Nestable Lock constructs defined by the OpenMP specification. In accordance with such specification, nestable locks may by acquired multiple times recursively by the same task without deadlocking. Nested locking and unlocking operations must be well parenthesized at any time, otherwise deadlock and/or undefined behaviour may occur. Codes requiring the possibility to lock multiple times recursively should use Nestable Locks. Codes NOT requiring the possibility to lock multiple times recursively should use Simple Locks (Simple Locks) instead, as they incur less processing overhead than Nestable Locks.

starpu_omp_nest_lock_t
starpu_omp_init_nest_lock()
starpu_omp_destroy_nest_lock()
starpu_omp_set_nest_lock()
starpu_omp_unset_nest_lock()
starpu_omp_test_nest_lock()

24.6.3 Critical Sections

The SORS implements support for OpenMP critical sections through the family of starpu_omp_critical functions. Critical sections may optionally be named. There is a single, common anonymous critical section. Mutual exclusion only occur within the scope of single critical section, either a named one or the anonymous one.

See also

starpu_omp_critical()
starpu_omp_critical_inline_begin()
starpu_omp_critical_inline_end()
24.6.4 Barriers

The SORS provides the `starpu_omp_barrier()` function to implement barriers over parallel region teams. In accordance with the OpenMP specification, the `starpu_omp_barrier()` function waits for every implicit task of the parallel region to reach the barrier and every explicit task launched by the parallel region to complete, before returning.

`starpu_omp_barrier()`
Chapter 25

Clustering a Machine

TODO: clarify and put more explanations, express how to create clusters using the context API.

25.1 General Ideas

Clusters are a concept introduced in this paper. This comes from a basic idea, making use of two level of parallelism in a DAG. We keep the DAG parallelism but consider on top of it that a task can contain internal parallelism. A good example is if each task in the DAG is OpenMP enabled.

The particularity of such tasks is that we will combine the power of two runtime systems: StarPU will manage the DAG parallelism and another runtime (e.g. OpenMP) will manage the internal parallelism. The challenge is in creating an interface between the two runtime systems so that StarPU can regroup cores inside a machine (creating what we call a "cluster") on top of which the parallel tasks (e.g. OpenMP tasks) will be ran in a contained fashion.

The aim of the cluster API is to facilitate this process in an automatic fashion. For this purpose, we depend on the hwloc tool to detect the machine configuration and then partition it into usable clusters.

An example of code running on clusters is available in examples/sched_ctx/parallel_tasks_with_cluster_api.c.

Let's first look at how to create one in practice, then we will detail their internals.

25.2 Creating Clusters

Partitioning a machine into clusters with the cluster API is fairly straightforward. The simplest way is to state under which machine topology level we wish to regroup all resources. This level is an HwLoc object, of the type hwloc__obj_type_t. More can be found in the hwloc documentation.

Once a cluster is created, the full machine is represented with an opaque structure starpu_cluster_machine. This can be printed to show the current machine state.

```c
struct starpu_cluster_machine *clusters;
clusters = starpu_cluster_machine(HWLOC_OBJ_SOCKET, 0);
starpu_cluster_print(clusters);

starpu_uncluster_machine(clusters);
```

The following graphic is an example of what a particular machine can look like once clusterized. The main difference is that we have less worker queues and tasks which will be executed on several resources at once. The execution of these tasks will be left to the internal runtime system, represented with a dashed box around the resources.
Creating clusters as shown in the example above will create workers able to execute OpenMP code by default. The cluster API aims in allowing to parametrize the cluster creation and can take a `va_list` of arguments as input after the HwLoc object (always terminated by a 0 value). These can help creating clusters of a type different from OpenMP, or create a more precise partition of the machine.

### 25.3 Example Of Constraining OpenMP

Clusters require being able to constrain the runtime managing the internal task parallelism (internal runtime) to the resources set by StarPU. The purpose of this is to express how StarPU must communicate with the internal runtime to achieve the required cooperation. In the case of OpenMP, StarPU will provide an awake thread from the cluster to execute this liaison. It will then provide on demand the process ids of the other resources supposed to be in the region. Finally, thanks to an OpenMP region we can create the required number of threads and bind each of them on the correct region. These will then be reused each time we encounter a `#pragma omp parallel` in the following computations of our program.

The following graphic is an example of what an OpenMP-type cluster looks like and how it represented in StarPU. We can see that one StarPU (black) thread is awake, and we need to create on the other resources the OpenMP threads (in pink).

Finally, the following code shows how to force OpenMP to cooperate with StarPU and create the aforementioned OpenMP threads constrained in the cluster’s resources set:

```c
void starpu_openmp_prologue(void * sched_ctx_id)
{
    int sched_ctx = *(int*)sched_ctx_id;
    int *cpuids = NULL;
    int ncpuids = 0;
    int workerid = starpu_worker_get_id();
```
25.4 Creating Custom Clusters

As was previously said it is possible to create clusters using another cluster type, in order to bind another internal runtime inside StarPU. This can be done with in several ways:

- By using the currently available functions
- By passing as argument a user defined function

Here are two examples:

```c
struct starpu_cluster_machine *clusters;
clusters = starpu_cluster_machine(HWLOC_OBJ_SOCKET, STARPU_CLUSTER_TYPE, STARPU_CLUSTER_GNU_OPENMP_MKL, 0);
```

This type of clusters is available by default only if StarPU is compiled with MKL. It uses MKL functions to set the number of threads which is more reliable when using an OpenMP implementation different from the Intel one.

```c
void foo_func(void* foo_arg);
...
int foo_arg = 0;
struct starpu_cluster_machine *clusters;
clusters = starpu_cluster_machine(HWLOC_OBJ_SOCKET, STARPU_CLUSTER_CREATE_FUNC, &foo_func, STARPU_CLUSTER_CREATE_FUNC_ARG, &foo_arg, 0);
```

25.5 Clusters With Scheduling

Contexts API As previously mentioned, the cluster API is implemented on top of Scheduling Contexts. Its main addition is to ease the creation of a machine CPU partition with no overlapping by using HwLoc, whereas scheduling contexts can use any number of any resources.

It is therefore possible, but not recommended, to create clusters using the scheduling contexts API. This can be useful mostly in the most complex machine configurations where the user has to dimension precisely clusters by hand using his own algorithm.

```c
/* the list of resources the context will manage */
int workerids[3] = {1, 3, 10};

/* indicate the list of workers assigned to it, the number of workers, 
the name of the context and the scheduling policy to be used within 
the context */
int id_ctx = starpu_sched_ctx_create(workerids, 3, "my_ctx", 0);

/* let StarPU know that the following tasks will be submitted to this context */
starpu_sched_ctx_set_task_context(id);

/* submit the task to StarPU */
starpu_task_submit(task);
```
As this example illustrates, creating a context without scheduling policy will create a cluster. The important change is that the user will have to specify an interface function between the two runtimes he plans to use. This can be done in the `prologue_callback_pop_func` field of the task. Such a function can be similar to the OpenMP thread team creation one.

Note that the OpenMP mode is the default one both for clusters and contexts. The result of a cluster creation is a woken up master worker and sleeping "slaves" which allow the master to run tasks on their resources. To create a cluster with woken up workers one can use the flag `STARPU_SCHED_CTX_AWAKE_WORKERS` with the scheduling context API and `STARPU_CLUSTER_AWAKE_WORKERS` with the cluster API as parameter to the creation function.
Part V

StarPU Reference API
Chapter 26

Execution Configuration Through Environment Variables

The behavior of the StarPU library and tools may be tuned thanks to the following environment variables.

26.1 Configuring Workers

**STARPU_NCPU** Specify the number of CPU workers (thus not including workers dedicated to control accelerators). Note that by default, StarPU will not allocate more CPU workers than there are physical CPUs, and that some CPUs are used to control the accelerators.

**STARPU_NCPUS** This variable is deprecated. You should use **STARPU_NCPU**.

**STARPU_NCUDA** Specify the number of CUDA devices that StarPU can use. If **STARPU_NCUDA** is lower than the number of physical devices, it is possible to select which CUDA devices should be used by the means of the environment variable **STARPU_WORKERS_CUDAID**. By default, StarPU will create as many CUDA workers as there are CUDA devices.

**STARPU_NWORKER_PER_CUDA** Specify the number of workers per CUDA device, and thus the number of kernels which will be concurrently running on the devices. The default value is 1.

**STARPU_CUDA_THREAD_PER_WORKER** Specify whether the cuda driver should use one thread per stream (1) or to use a single thread to drive all the streams of the device or all devices (0), and **STARPU_CUDA_THREAD_PER_DEV** determines whether is it one thread per device or one thread for all devices. The default value is 0. Setting it to 1 is contradictory with setting **STARPU_CUDA_THREAD_PER_DEV**.

**STARPU_CUDA_THREAD_PER_DEV** Specify whether the cuda driver should use one thread per device (1) or to use a single thread to drive all the devices (0). The default value is 1. It does not make sense to set this variable if **STARPU_CUDA_THREAD_PER_WORKER** is set to to 1 (since **STARPU_CUDA_THREAD_PER_DEV** is then meaningless).

**STARPU_CUDA_PIPELINE** Specify how many asynchronous tasks are submitted in advance on CUDA devices. This for instance permits to overlap task management with the execution of previous tasks, but it also allows concurrent execution on Fermi cards, which otherwise bring spurious synchronizations. The default is 2. Setting the value to 0 forces a synchronous execution of all tasks.

**STARPU_NOPENCL** OpenCL equivalent of the environment variable **STARPU_NCUDA**.

**STARPU_OPENCL_PIPELINE** Specify how many asynchronous tasks are submitted in advance on OpenCL devices. This for instance permits to overlap task management with the execution of previous tasks, but it also allows concurrent execution on Fermi cards, which otherwise bring spurious synchronizations. The default is 2. Setting the value to 0 forces a synchronous execution of all tasks.

**STARPU_OPENCL_ON_CPUS** By default, the OpenCL driver only enables GPU and accelerator devices. By setting the environment variable **STARPU_OPENCL_ON_CPUS** to 1, the OpenCL driver will also enable CPU devices.
STARPU_OPENCL_ONLY_ON_CPUS By default, the OpenCL driver enables GPU and accelerator devices. By setting the environment variable STARPU_OPENCL_ONLY_ON_CPUS to 1, the OpenCL driver will ONLY enable CPU devices.

STARPU_NMIC MIC equivalent of the environment variable STARPU_NCUDA, i.e. the number of MIC devices to use.

STARPU_NMICTHREADS Number of threads to use on the MIC devices.

STARPU_NMPI_MS MPI Master Slave equivalent of the environment variable STARPU_NCUDA, i.e. the number of MPI Master Slave devices to use.

STARPU_NMPIMSTHREADS Number of threads to use on the MPI Slave devices.

STARPU_MPI_MASTER_NODE This variable allows to chose which MPI node (with the MPI ID) will be the master.

STARPU_NSCC SCC equivalent of the environment variable STARPU_NCUDA.

STARPU_WORKERS_NOBIND Setting it to non-zero will prevent StarPU from binding its threads to CPUs. This is for instance useful when running the testsuite in parallel.

STARPU_WORKERS_CPUID Passing an array of integers in STARPU_WORKERS_CPUID specifies on which logical CPU the different workers should be bound. For instance, if STARPU_WORKERS_CPUID = "0 1 4 5 ", the first worker will be bound to logical CPU #0, the second CPU worker will be bound to logical CPU #1 and so on. Note that the logical ordering of the CPUs is either determined by the OS, or provided by the library hwloc in case it is available. Ranges can be provided: for instance, STARPU_WORKERS_CPUID = "1-3 5 " will bind the first three workers on logical CPUs #1, #2, and #3, and the fourth worker on logical CPU #5. Unbound ranges can also be provided: STARPU_WORKERS_CPUID = "1-" will bind the workers starting from logical CPU #1 up to last CPU.

Note that the first workers correspond to the CUDA workers, then come the OpenCL workers, and finally the CPU workers. For example if we have STARPU_NCUDA=1, STARPU_NOPENCL=1, STARPU_NCPU=2 and STARPU_WORKERS_CPUID = "0 2 1 3 ", the CUDA device will be controlled by logical CPU #0, the OpenCL device will be controlled by logical CPU #2, and the logical CPUs #1 and #3 will be used by the CPU workers.

If the number of workers is larger than the array given in STARPU_WORKERS_CPUID, the workers are bound to the logical CPUs in a round-robin fashion: if STARPU_WORKERS_CPUID = "0 1 ", the first and the third (resp. second and fourth) workers will be put on CPU #0 (resp. CPU #1).

Note that the first workers correspond to the CUDA workers, then come the OpenCL workers, and finally the CPU workers. For example if we have STARPU_NCUDA=1, STARPU_NOPENCL=1, STARPU_NCPU=2 and STARPU_WORKERS_CPUID = "0 2 1 3 ", the CUDA device will be controlled by logical CPU #0, the OpenCL device will be controlled by logical CPU #2, and the logical CPUs #1 and #3 will be used by the CPU workers.

If the number of workers is larger than the array given in STARPU_WORKERS_CPUID, the workers are bound to the logical CPUs in a round-robin fashion: if STARPU_WORKERS_CPUID = "0 1 ", the first and the third (resp. second and fourth) workers will be put on CPU #0 (resp. CPU #1).

This variable is ignored if the field starpu_conf::use_explicit_workers_bindid passed to starpu_init() is set.

STARPU_MAIN_THREAD_CPUID When defined, this make StarPU bind the thread that calls starpu_initialize() to the given CPU ID.

STARPU_MPI_THREAD_CPUID When defined, this make StarPU bind its MPI thread to the given CPU ID.

STARPU_WORKERS_CUDAID Similarly to the STARPU_WORKERS_CPUID environment variable, it is possible to select which CUDA devices should be used by StarPU. On a machine equipped with 4 GPUs, setting STARPU_WORKERS_CUDAID = "1 3 ", the third and the fourth workers will be put on GPU #3.

This variable is ignored if the field starpu_conf::use_explicit_workers_cuda_gpuid passed to starpu_init() is set.

STARPU_WORKERS_OOPENCLID OpenCL equivalent of the STARPU_WORKERS_CUDAID environment variable.

This variable is ignored if the field starpu_conf::use_explicit_workers_opencl_gpuid passed to starpu_init() is set.

STARPU_WORKERS_MICID MIC equivalent of the STARPU_WORKERS_CUDAID environment variable.

This variable is ignored if the field starpu_conf::use_explicit_workers_mic_deviceid passed to starpu_init() is set.
STARPU_WORKERS_SCCID  SCC equivalent of the STARPU_WORKERS_CUDAID environment variable.

This variable is ignored if the field starpu_conf::use_explicit_workers_scc_deviceid passed to starpu_init() is set.

STARPU_WORKER_TREE  Define to 1 to enable the tree iterator in schedulers.

STARPU_SINGLE_COMBINED_WORKER  If set, StarPU will create several workers which won't be able to work concurrently. It will by default create combined workers which size goes from 1 to the total number of CPU workers in the system. STARPU_MIN_WORKERSIZE and STARPU_MAX_WORKERSIZE can be used to change this default.

STARPU_MIN_WORKERSIZE  STARPU_MIN_WORKERSIZE permits to specify the minimum size of the combined workers (instead of the default 2).

STARPU_MAX_WORKERSIZE  STARPU_MAX_WORKERSIZE permits to specify the minimum size of the combined workers (instead of the number of CPU workers in the system).

STARPU_SYNTHESIZE_ARITY_COMBINED_WORKER  Let the user decide how many elements are allowed between combined workers created from hwloc information. For instance, in the case of sockets with 6 cores without shared L2 caches, if STARPU_SYNTHESIZE_ARITY_COMBINED_WORKER is set to 6, no combined worker will be synthesized beyond one for the socket and one per core. If it is set to 3, 3 intermediate combined workers will be synthesized, to divide the socket cores into 3 chunks of 2 cores. If it set to 2, 2 intermediate combined workers will be synthesized, to divide the the socket cores into 2 chunks of 3 cores, and then 3 additional combined workers will be synthesized, to divide the former synthesized workers into a bunch of 2 cores, and the remaining core (for which no combined worker is synthesized since there is already a normal worker for it).

The default, 2, thus makes StarPU tend to building a binary trees of combined workers.

STARPU_DISABLE_ASYNCHRONOUS_COPY  Disable asynchronous copies between CPU and GPU devices. The AMD implementation of OpenCL is known to fail when copying data asynchronously. When using this implementation, it is therefore necessary to disable asynchronous data transfers.

STARPU_DISABLE_ASYNCHRONOUS_CUDA_COPY  Disable asynchronous copies between CPU and CUDA devices.

STARPU_DISABLE_ASYNCHRONOUS_OPENCL_COPY  Disable asynchronous copies between CPU and OpenCL devices. The AMD implementation of OpenCL is known to fail when copying data asynchronously. When using this implementation, it is therefore necessary to disable asynchronous data transfers.

STARPU_DISABLE_ASYNCHRONOUS_MIC_COPY  Disable asynchronous copies between CPU and MIC devices.

STARPU_DISABLE_ASYNCHRONOUS_MPI_MS_COPY  Disable asynchronous copies between CPU and MPI Slave devices.

STARPU_ENABLE_CUDA_GPU_GPU_DIRECT  Enable (1) or Disable (0) direct CUDA transfers from GPU to GPU, without copying through RAM. The default is Enabled. This permits to test the performance effect of GPU-Direct.

STARPU_DISABLE_PINNING  Disable (1) or Enable (0) pinning host memory allocated through starpu_malloc, starpu_memory_pin and friends. The default is Enabled. This permits to test the performance effect of memory pinning.

STARPU_MIC_SINK_PROGRAM_NAME  todo

STARPU_MIC_SINK_PROGRAM_PATH  todo

STARPU_MIC_PROGRAM_PATH  todo
26.2 Configuring The Scheduling Engine

**STARPU_SCHED** Choose between the different scheduling policies proposed by StarPU: work random, stealing, greedy, with performance models, etc.

Use **STARPU_SCHED=help** to get the list of available schedulers.

**STARPU_MIN_PRIO** Set the minimum priority used by priorities-aware schedulers.

**STARPU_MAX_PRIO** Set the maximum priority used by priorities-aware schedulers.

**STARPU_CALIBRATE** If this variable is set to 1, the performance models are calibrated during the execution. If it is set to 2, the previous values are dropped to restart calibration from scratch. Setting this variable to 0 disable calibration, this is the default behaviour.

Note: this currently only applies to dm and dmda scheduling policies.

**STARPU_CALIBRATE_MINIMUM** This defines the minimum number of calibration measurements that will be made before considering that the performance model is calibrated. The default value is 10.

**STARPU_BUS_CALIBRATE** If this variable is set to 1, the bus is recalibrated during initialization.

**STARPU_PREFETCH** This variable indicates whether data prefetching should be enabled (0 means that it is disabled). If prefetching is enabled, when a task is scheduled to be executed e.g. on a GPU, StarPU will request an asynchronous transfer in advance, so that data is already present on the GPU when the task starts. As a result, computation and data transfers are overlapped. Note that prefetching is enabled by default in StarPU.

**STARPU_SCHED_ALPHA** To estimate the cost of a task StarPU takes into account the estimated computation time (obtained thanks to performance models). The alpha factor is the coefficient to be applied to it before adding it to the communication part.

**STARPU_SCHED_BETA** To estimate the cost of a task StarPU takes into account the estimated data transfer time (obtained thanks to performance models). The beta factor is the coefficient to be applied to it before adding it to the computation part.

**STARPU_SCHED_GAMMA** Define the execution time penalty of a joule (Energy-based Scheduling).

**STARPU_IDLE_POWER** Define the idle power of the machine (Energy-based Scheduling).

26.3 Extensions

**SOCL_OCL_LIB_OPENCL** THE SOCL test suite is only run when the environment variable **SOCL_OCL_LIB_OPENCL** is defined. It should contain the location of the file libOpenCL.so of the OCL ICD implementation.

**OCL_ICD_VENDORS** When using SOCL with OpenCL ICD (https://forge.imag.fr/projects/ocl-icd/), this variable may be used to point to the directory where ICD files are installed. The default directory is /etc/OpenCL/vendors. StarPU installs ICD files in the directory $prefix/share/starpu/opencl/vendors.

**STARPU_COMM_STATS** Communication statistics for starpumpi (MPI Support) will be enabled when the environment variable **STARPU_COMM_STATS** is defined to an value other than 0.

**STARPU_MPI_CACHE** Communication cache for starpumpi (MPI Support) will be disabled when the environment variable **STARPU_MPI_CACHE** is set to 0. It is enabled by default or for any other values of the variable **STARPU_MPI_CACHE**.

**STARPU_MPI_COMM** Communication trace for starpumpi (MPI Support) will be enabled when the environment variable **STARPU_MPI_COMM** is set to 1, and StarPU has been configured with the option --enable-verbose.

**STARPU_MPI_CACHE_STATS** When set to 1, statistics are enabled for the communication cache (MPI Support). For now, it prints messages on the standard output when data are added or removed from the received communication cache.
26.4 Miscellaneous And Debug

**STARPU_MPI_PRIORITIES** When set to 0, the use of priorities to order MPI communications is disabled (MPI Support).

**STARPU_MPI_FAKE_SIZE** Setting to a number makes StarPU believe that there are as many MPI nodes, even if it was run on only one MPI node. This allows e.g. to simulate the execution of one of the nodes of a big cluster without actually running the rest. It of course does not provide computation results and timing.

**STARPU_MPI_FAKE_RANK** Setting to a number makes StarPU believe that it runs the given MPI node, even if it was run on only one MPI node. This allows e.g. to simulate the execution of one of the nodes of a big cluster without actually running the rest. It of course does not provide computation results and timing.

**STARPU_MPI_DRIVER_CALL_FREQUENCY** When set to a positive value, activates the interleaving of the execution of tasks with the progression of MPI communications (MPI Support). The `starpu_mpi_init_with_driver()` function must have been called by the application for that environment variable to be used. When set to 0, the MPI progression thread does not use at all the driver given by the user, and only focuses on making MPI communications progress.

**STARPU_MPI_DRIVER_TASK_FREQUENCY** When set to a positive value, the interleaving of the execution of tasks with the progression of MPI communications mechanism to execute several tasks before checking communication requests again (MPI Support). The `starpu_mpi_init_with_driver()` function must have been called by the application for that environment variable to be used, and the `STARPU_MPI_DRIVER_CALL_FREQUENCY` environment variable set to a positive value.

**STARPU_SIMGRID_CUDA_MALLOC_COST** When set to 1 (which is the default), CUDA malloc costs are taken into account in simgrid mode.

**STARPU_SIMGRID_CUDA_QUEUE_COST** When set to 1 (which is the default), CUDA task and transfer queueing costs are taken into account in simgrid mode.

**STARPU_PCI_FLAT** When unset or set to 0, the platform file created for simgrid will contain PCI bandwidths and routes.

**STARPU_SIMGRID_QUEUE_MALLOC_COST** When unset or set to 1, simulate within simgrid the GPU transfer queueing.

**STARPU_MALLOC_SIMULATION_FOLD** This defines the size of the file used for folding virtual allocation, in MiB. The default is 1, thus allowing 64GiB virtual memory when Linux's `sysctl vm.max_map_count` value is the default 65535.

**STARPU_SIMGRID_TASK_SUBMIT_COST** When set to 1 (which is the default), task submission costs are taken into account in simgrid mode. This provides more accurate simgrid predictions, especially for the beginning of the execution.

**STARPU_SIMGRID_FETCHING_INPUT_COST** When set to 1 (which is the default), fetching input costs are taken into account in simgrid mode. This provides more accurate simgrid predictions, especially regarding data transfers.

**STARPU_SIMGRID_SCHED_COST** When set to 1 (0 is the default), scheduling costs are taken into account in simgrid mode. This provides more accurate simgrid predictions, and allows studying scheduling overhead of the runtime system. However, it also makes simulation non-deterministic.

26.4 Miscellaneous And Debug

**STARPU_HOME** This specifies the main directory in which StarPU stores its configuration files. The default is `$HOME` on Unix environments, and `$USERPROFILE` on Windows environments.

**STARPU_PATH** Only used on Windows environments. This specifies the main directory in which StarPU is installed (Running a Basic StarPU Application on Microsoft Visual C)

**STARPU_PERF_MODEL_DIR** This specifies the main directory in which StarPU stores its performance model files. The default is `$STARPU_HOME/.starpu/sampling`. 

Generated by Doxygen
STARPU_PERF_MODEL_HOMOGENEOUS_CPU When this is set to 0, StarPU will assume that CPU devices do not have the same performance, and thus use different performance models for them, thus making kernel calibration much longer, since measurements have to be made for each CPU core.

STARPU_PERF_MODEL_HOMOGENEOUS_CUDA When this is set to 1, StarPU will assume that all CUDA devices have the same performance, and thus share performance models for them, thus allowing kernel calibration to be much faster, since measurements only have to be once for all CUDA GPUs.

STARPU_PERF_MODEL_HOMOGENEOUS_OPENCL When this is set to 1, StarPU will assume that all OPE devices have the same performance, and thus share performance models for them, thus allowing kernel calibration to be much faster, since measurements only have to be once for all OPENCL GPUs.

STARPU_PERF_MODEL_HOMOGENEOUS_MIC When this is set to 1, StarPU will assume that all MIC devices have the same performance, and thus share performance models for them, thus allowing kernel calibration to be much faster, since measurements only have to be once for all MIC GPUs.

STARPU_PERF_MODEL_HOMOGENEOUS_MPI_MS When this is set to 1, StarPU will assume that all MPI Slave devices have the same performance, and thus share performance models for them, thus allowing kernel calibration to be much faster, since measurements only have to be once for all MPI Slaves.

STARPU_PERF_MODEL_HOMOGENEOUS_SCC When this is set to 1, StarPU will assume that all SCC devices have the same performance, and thus share performance models for them, thus allowing kernel calibration to be much faster, since measurements only have to be once for all SCC GPUs.

STARPU_HOSTNAME When set, force the hostname to be used when dealing performance model files. Models are indexed by machine name. When running for example on a homogeneous cluster, it is possible to share the models between machines by setting export STARPU_HOSTNAME=some_global_name.

STARPU_OPENCL_PROGRAM_DIR This specifies the directory where the OpenCL codelet source files are located. The function starpu_opencl_load_program_source() looks for the codelet in the current directory, in the directory specified by the environment variable STARPU_OPENCL_PROGRAM_DIR, in the directory share/starpu/opencl of the installation directory of StarPU, and finally in the source directory of StarPU.

STARPU_SILENT This variable allows to disable verbose mode at runtime when StarPU has been configured with the option --enable-verbose. It also disables the display of StarPU information and warning messages.

STARPU_LOGFILENAME This variable specifies in which file the debugging output should be saved to.

STARPU_FXT_PREFIX This variable specifies in which directory to save the trace generated if FxT is enabled. It needs to have a trailing '/' character.

STARPU_FXT_TRACE This variable specifies whether to generate (1) or not (0) the FxT trace in /tmp/prof_file_XXX_YYY. The default is 1 (generate it)

STARPU_LIMIT_CUDA_devid_MEM This variable specifies the maximum number of megabytes that should be available to the application on the CUDA device with the identifier devid. This variable is intended to be used for experimental purposes as it emulates devices that have a limited amount of memory. When defined, the variable overwrites the value of the variable STARPU_LIMIT_CUDA_MEM.

STARPU_LIMIT_CUDA_MEM This variable specifies the maximum number of megabytes that should be available to the application on each CUDA device. This variable is intended to be used for experimental purposes as it emulates devices that have a limited amount of memory.

STARPU_LIMIT_OPENCL_devid_MEM This variable specifies the maximum number of megabytes that should be available to the application on the OpenCL device with the identifier devid. This variable is intended to be used for experimental purposes as it emulates devices that have a limited amount of memory. When defined, the variable overwrites the value of the variable STARPU_LIMIT_OPENCL_MEM.

STARPU_LIMIT_OPENCL_MEM This variable specifies the maximum number of megabytes that should be available to the application on each OpenCL device. This variable is intended to be used for experimental purposes as it emulates devices that have a limited amount of memory.
STARPU_LIMIT_CPU_MEM  This variable specifies the maximum number of megabytes that should be available to the application in the main CPU memory. Setting it enables allocation cache in main memory. Setting it to zero lets StarPU overflow memory.

STARPU_LIMIT_CPU_NUMA_devid_MEM  This variable specifies the maximum number of megabytes that should be available to the application on the NUMA node with the OS identifier devid.

STARPU_MINIMUM_AVAILABLE_MEM  This specifies the minimum percentage of memory that should be available in GPUs (or in main memory, when using out of core), below which a reclaiming pass is performed. The default is 0%.

STARPU_TARGET_AVAILABLE_MEM  This specifies the target percentage of memory that should be reached in GPUs (or in main memory, when using out of core), when performing a periodic reclaiming pass. The default is 0%.

STARPU_MINIMUM_CLEAN_BUFFERS  This specifies the minimum percentage of number of buffers that should be clean in GPUs (or in main memory, when using out of core), below which asynchronous writebacks will be issued. The default is 5%.

STARPU_TARGET_CLEAN_BUFFERS  This specifies the target percentage of number of buffers that should be reached in GPUs (or in main memory, when using out of core), when performing an asynchronous writeback pass. The default is 10%.

STARPU_DIDUSE_BARRIER  When set to 1, StarPU will never evict a piece of data if it has not been used by at least one task. This avoids odd behaviors under high memory pressure, but can lead to deadlocks, so is to be considered experimental only.

STARPU_DISK_SWAP  This specifies a path where StarPU can push data when the main memory is getting full.

STARPU_DISK_SWAP_BACKEND  This specifies then backend to be used by StarPU to push data when the main memory is getting full. The default is unistd (i.e. using read/write functions), other values are stdio (i.e. using fread/fwrite), unistd_o_direct (i.e. using read/write with O_DIRECT), leveldb (i.e. using a leveldb database), and hdf5 (i.e. using HDF5 library).

STARPU_DISK_SWAP_SIZE  This specifies then maximum size in MiB to be used by StarPU to push data when the main memory is getting full. The default is unlimited.

STARPU_LIMIT_MAX_SUBMITTED_TASKS  This variable allows the user to control the task submission flow by specifying to StarPU a maximum number of submitted tasks allowed at a given time, i.e. when this limit is reached task submission becomes blocking until enough tasks have completed, specified by STARPU_LIM_MIN_SUBMITTED_TASKS. Setting it enables allocation cache buffer reuse in main memory.

STARPU_LIMIT_MIN_SUBMITTED_TASKS  This variable allows the user to control the task submission flow by specifying to StarPU a submitted task threshold to wait before unblocking task submission. This variable has to be used in conjunction with STARPU_LIMIT_MAX_SUBMITTED_TASKS which puts the task submission thread to sleep. Setting it enables allocation cache buffer reuse in main memory.

STARPU_TRACE_BUFFER_SIZE  This sets the buffer size for recording trace events in MiB. Setting it to a big size allows to avoid pauses in the trace while it is recorded on the disk. This however also consumes memory, of course. The default value is 64.

STARPU_GENERATE_TRACE  When set to 1, this variable indicates that StarPU should automatically generate a Paje trace when starpu_shutdown() is called.

STARPU_GENERATE_TRACE_OPTIONS  When the variable STARPU_GENERATE_TRACE is set to 1 to generate a Paje trace, this variable can be set to specify options (see starpu_fxt_tool -help).

STARPU_ENABLE_STATS  When defined, enable gathering various data statistics (Data Statistics).

STARPU_MEMORY_STATS  When set to 0, disable the display of memory statistics on data which have not been unregistered at the end of the execution (Memory Feedback).

STARPU_MAX_MEMORY_USE  When set to 1, display at the end of the execution the maximum memory used by StarPU for internal data structures during execution.
STARPU_BUS_STATS  When defined, statistics about data transfers will be displayed when calling starpu_shutdown() (Profiling).

STARPU_WORKER_STATS  When defined, statistics about the workers will be displayed when calling starpu_shutdown() (Profiling). When combined with the environment variable STARPU_PROFILING, it displays the energy consumption (Energy-based Scheduling).

STARPU_STATS  When set to 0, data statistics will not be displayed at the end of the execution of an application (Data Statistics).

STARPU_WATCHDOG_TIMEOUT  When set to a value other than 0, allows to make StarPU print an error message whenever StarPU does not terminate any task for the given time (in µs), but lets the application continue normally. Should be used in combination with STARPU_WATCHDOG_CRASH (see Detecting Stuck Conditions).

STARPU_WATCHDOG_CRASH  When set to a value other than 0, it triggers a crash when the watch dog is reached, thus allowing to catch the situation in gdb, etc (see Detecting Stuck Conditions)

STARPU_WATCHDOG_DELAY  This delays the activation of the watchdog by the given time (in µs). This can be convenient for letting the application initialize data etc. before starting to look for idle time.

STARPU_TASK_BREAK_ON_PUSH  When this variable contains a job id, StarPU will raise SIGTRAP when the task with that job id is being pushed to the scheduler, which will be nicely caught by debuggers (see Debugging Scheduling)

STARPU_TASK_BREAK_ON_SCHED  When this variable contains a job id, StarPU will raise SIGTRAP when the task with that job id is being scheduled by the scheduler (at a scheduler-specific point), which will be nicely caught by debuggers. This only works for schedulers which have such a scheduling point defined (see Debugging Scheduling)

STARPU_TASK_BREAK_ON_POP  When this variable contains a job id, StarPU will raise SIGTRAP when the task with that job id is being popped from the scheduler, which will be nicely caught by debuggers (see Debugging Scheduling)

STARPU_TASK_BREAK_ON_EXEC  When this variable contains a job id, StarPU will raise SIGTRAP when the task with that job id is being executed, which will be nicely caught by debuggers (see Debugging Scheduling)

STARPU_DISABLE_KERNELS  When set to a value other than 1, it disables actually calling the kernel functions, thus allowing to quickly check that the task scheme is working properly, without performing the actual application-provided computation.

STARPU_HISTORY_MAX_ERROR  History-based performance models will drop measurements which are really far from the measured average. This specifies the allowed variation. The default is 50 (%), i.e. the measurement is allowed to be x1.5 faster or /1.5 slower than the average.

STARPU_RAND_SEED  The random scheduler and some examples use random numbers for their own working. Depending on the examples, the seed is by default just always 0 or the current time() (unless simgrid mode is enabled, in which case it is always 0). STARPU_RAND_SEED allows to set the seed to a specific value.

STARPU_IDLE_TIME  When set to a value being a valid filename, a corresponding file will be created when shutting down StarPU. The file will contain the sum of all the workers’ idle time.

STARPU_GLOBAL_ARBITER  When set to a positive value, StarPU will create a arbiter, which implements an advanced but centralized management of concurrent data accesses (see Concurrent Data Accesses).

STARPU_USE_NUMA  When defined, NUMA nodes are taking into account by StarPU. Otherwise, memory is considered as only one node. This is experimental for now.
   When enabled, STARPU_MAIN_MEMORY is a pointer to the NUMA node associated to the first CPU worker if it exists, the NUMA node associated to the first GPU discovered otherwise. If StarPU doesn’t find any NUMA node after these step, STARPU_MAIN_MEMORY is the first NUMA node discovered by StarPU.

STARPU_IDLE_FILE  If the environment variable STARPU_IDLE_FILE is defined, a file named after its contents will be created at the end of the execution. The file will contain the sum of the idle times of all the workers.
26.5 Configuring The Hypervisor

**SC_HYPERVISOR_POLICY** Choose between the different resizing policies proposed by StarPU for the hypervisor: idle, app_driven, feft_lp, teft_lp; ispeed_lp, throughput_lp etc.
Use **SC_HYPERVISOR_POLICY=help** to get the list of available policies for the hypervisor

**SC_HYPERVISOR_TRIGGER_RESIZE** Choose how should the hypervisor be triggered: speed if the resizing algorithm should be called whenever the speed of the context does not correspond to an optimal precomputed value, idle if the resizing algorithm should be called whenever the workers are idle for a period longer than the value indicated when configuring the hypervisor.

**SC_HYPERVISOR_START_RESIZE** Indicate the moment when the resizing should be available. The value correspond to the percentage of the total time of execution of the application. The default value is the resizing frame.

**SC_HYPERVISOR_MAX_SPEED_GAP** Indicate the ratio of speed difference between contexts that should trigger the hypervisor. This situation may occur only when a theoretical speed could not be computed and the hypervisor has no value to compare the speed to. Otherwise the resizing of a context is not influenced by the the speed of the other contexts, but only by the the value that a context should have.

**SC_HYPERVISOR_STOP_PRINT** By default the values of the speed of the workers is printed during the execution of the application. If the value 1 is given to this environment variable this printing is not done.

**SC_HYPERVISOR_LAZY_RESIZE** By default the hypervisor resizes the contexts in a lazy way, that is workers are firstly added to a new context before removing them from the previous one. Once this workers are clearly taken into account into the new context (a task was poped there) we remove them from the previous one. However if the application would like that the change in the distribution of workers should change right away this variable should be set to 0

**SC_HYPERVISOR_SAMPLE_CRITERIA** By default the hypervisor uses a sample of flops when computing the speed of the contexts and of the workers. If this variable is set to time the hypervisor uses a sample of time (10% of an approximation of the total execution time of the application)
Chapter 27

Compilation Configuration

The behavior of the StarPU library and tools may be tuned thanks to the following configure options.

27.1 Common Configuration

–enable-debug Enable debugging messages.

–enable-spinlock-check Enable checking that spinlocks are taken and released properly.

–enable-fast Disable assertion checks, which saves computation time.

–enable-verbose Increase the verbosity of the debugging messages. This can be disabled at runtime by setting the environment variable STARPU_SILENT to any value. –enable-verbose=extra increase even more the verbosity.

$ STARPU_SILENT=1 ./vector_scal

–enable-coverage Enable flags for the coverage tool gcov.

–enable-quick-check Specify tests and examples should be run on a smaller data set, i.e allowing a faster execution time

–enable-long-check Enable some exhaustive checks which take a really long time.

–enable-new-check Enable new testcases which are known to fail.

–with-hwloc Specify hwloc should be used by StarPU. hwloc should be found by the means of the tool pkg-config.

–with-hwloc=prefix Specify hwloc should be used by StarPU. hwloc should be found in the directory specified by prefix

–without-hwloc Specify hwloc should not be used by StarPU.

–disable-build-doc Disable the creation of the documentation. This should be done on a machine which does not have the tools doxygen and latex (plus the packages latex-xcolor and texlive-latex-extra).

–disable-icc Disable the usage of the ICC compiler. When found, some specific ICC examples are compiled.

Additionally, the script configure recognize many variables, which can be listed by typing ./configure

help. For example, ./configure NVCCFLAGS="-arch sm_20" adds a flag for the compilation of CUDA kernels, and NVCC_CC=gcc-5 allows to change the C++ compiler used by nvcc.
27.2 Configuring Workers

`–enable-blocking-drivers` By default, StarPU keeps CPU workers awake permanently, for better reactivity. This option makes StarPU put CPU workers to real sleep when there are not enough tasks to compute.

`–enable-worker-callbacks` If blocking drivers are enabled, enable callbacks to notify an external resource manager about workers going to sleep and waking up.

`–enable-maxcpus=count` Use at most count CPU cores. This information is then available as the macro STARPU_MAXCPUS.

`–enable-maxnumanodes=count` Use at most count NUMA nodes. This information is then available as the macro STARPU_MAXNUMANODES.

`–disable-cpu` Disable the use of CPUs of the machine. Only GPUs etc. will be used.

`–enable-maxcudadev=count` Use at most count CUDA devices. This information is then available as the macro STARPU_MAXCUDADEVS.

`–disable-cuda` Disable the use of CUDA, even if a valid CUDA installation was detected.

`–with-cuda-dir=prefix` Search for CUDA under prefix, which should notably contain the file include/cuda.h.

`–with-cuda-include-dir=dir` Search for CUDA headers under dir, which should notably contain the file cuda.h. This defaults to /include appended to the value given to --with-cuda-dir.

`–with-cuda-lib-dir=dir` Search for CUDA libraries under dir, which should notably contain the CUDA shared libraries—e.g., libcuda.so. This defaults to /lib appended to the value given to --with-cuda-dir.

`–disable-cuda-memcpy-peer` Explicitly disable peer transfers when using CUDA 4.0.

`–enable-maxopencldev=count` Use at most count OpenCL devices. This information is then available as the macro STARPU_MAXOPENCLDEVS.

`–disable-opencl` Disable the use of OpenCL, even if the SDK is detected.

`–with-opencl-dir=prefix` Search for an OpenCL implementation under prefix, which should notably contain include/CL/cl.h (or include/OpenCL/cl.h on Mac OS).

`–with-opencl-include-dir=dir` Search for OpenCL headers under dir, which should notably contain CL/cl.h (or OpenCL/cl.h on Mac OS). This defaults to /include appended to the value given to --with-opencl-dir.

`–with-opencl-lib-dir=dir` Search for an OpenCL library under dir, which should notably contain the OpenCL shared libraries—e.g. libOpenCL.so. This defaults to /lib appended to the value given to --with-opencl-dir.

`–enable-opencl-simulator` Enable considering the provided OpenCL implementation as a simulator, i.e. use the kernel duration returned by OpenCL profiling information as wallclock time instead of the actual measured real time. This requires simgrid support.

`–enable-maximplementations=count` Allow for at most count codelet implementations for the same target device. This information is then available as the macro STARPU_MAXIMPLEMENTATIONS.

`–enable-max-sched-ctxs=count` Allow for at most count scheduling contexts. This information is then available as the macro STARPU_NMAX_SCHED_CTXS.

`–disable-asynchronous-copy` Disable asynchronous copies between CPU and GPU devices. The AMD implementation of OpenCL is known to fail when copying data asynchronously. When using this implementation, it is therefore necessary to disable asynchronous data transfers.

`–disable-asynchronous-cuda-copy` Disable asynchronous copies between CPU and CUDA devices.

`–disable-asynchronous-opencl-copy` Disable asynchronous copies between CPU and OpenCL devices. The AMD implementation of OpenCL is known to fail when copying data asynchronously. When using this implementation, it is therefore necessary to disable asynchronous data transfers.
--enable-maxmicthreads Specify the maximum number of MIC threads

--disable-asynchronous-mic-copy Disable asynchronous copies between CPU and MIC devices.

--disable-asynchronous-mpi-master-slave-copy Disable asynchronous copies between CPU and MPI Slave devices.

--enable-maxnodes=count Use at most count memory nodes. This information is then available as the macro STARPU_MAXNODES. Reducing it allows to considerably reduce memory used by StarPU data structures.

27.3 Extension Configuration

--disable-mpi Disable the build of libstarpumpi. By default, it is enabled when MPI is found.

--with-mpicc=path Use the compiler mpicc at path, for StarPU-MPI. (MPI Support).

--enable-mpi-pedantic-isend Before performing any MPI communication, StarPU-MPI waits for the data to be available in the main memory of the node submitting the request. For send communications, data is acquired with the mode STARPU_R. When enabling the pedantic mode, data are instead acquired with the STARPU_RW which thus ensures that there is not more than 1 concurrent MPI_Isend calls accessing the data.

--enable-mpi-master-slave Enable the MPI Master-Slave support. By default, it is disabled.

--with-mpi-master-slave-multiple-thread Create one thread per MPI Slave on the MPI master to manage communications.

--enable-mpi-verbose Increase the verbosity of the MPI debugging messages. This can be disabled at runtime by setting the environment variable STARPU_SILENT to any value. --enable-mpi-verbose=extra increase even more the verbosity.

$ STARPU_SILENT=1 mpirun -np 2 ./insert_task

--enable-nmad Enable the NewMadeleine implementation for StarPU-MPI.

--disable-fortran Disable the fortran extension. By default, it is enabled when a fortran compiler is found.

--disable-socl Disable the SOCL extension (SOCL OpenCL Extensions). By default, it is enabled when an OpenCL implementation is found.

--disable-starpu-top Disable the StarPU-Top interface (StarPU-Top Interface). By default, it is enabled when the required dependencies are found.

--disable-gcc-extensions Disable the GCC plug-in (C Extensions). By default, it is enabled when the GCC compiler provides a plug-in support.

--with-coi-dir Specify the directory to the COI library for MIC support. The default value is /opt/intel/mic/coi

--mic-host Specify the precise MIC architecture host identifier. The default value is x86_64-k1om-linux

--enable-openmp Enable OpenMP Support (The StarPU OpenMP Runtime Support (SORS))

27.4 Advanced Configuration

--enable-perf-debug Enable performance debugging through gprof.

--enable-model-debug Enable performance model debugging.

--enable-ftx-lock Enable additional trace events which describes locks behaviour. This is however extremely heavy and should only be enabled when debugging insides of StarPU.

--enable-maxbuffers Define the maximum number of buffers that tasks will be able to take as parameters, then available as the macro STARPU_NMAXBUFS.
–enable-allocation-cache  Enable the use of a data allocation cache to avoid the cost of it with CUDA. Still experimental.

–enable-opengl-render  Enable the use of OpenGL for the rendering of some examples.

–enable-blas-lib=prefix  Specify the blas library to be used by some of the examples. Libraries available:

- none [default]: no BLAS library is used
- atlas: use ATLAS library
- goto: use GotoBLAS library
- openblas: use OpenBLAS library
- mkl: use MKL library (you may need to set specific CFLAGS and LDFLAGS with --with-mkl-cflags and --with-mkl-ldflags)

–enable-leveldb  Enable linking with LevelDB if available

–disable-hdf5  Disable building HDF5 support.

–with-hdf5-include-dir=path  Specify the directory where is stored the header hdf5.h.

–with-hdf5-lib-dir=path  Specify the directory where is stored the hdf5 library.

–disable-starpufft  Disable the build of libstarpufft, even if fftw or cuFFT is available.

–enable-starpufft-examples  Enable the compilation and the execution of the libstarpufft examples. By default, they are neither compiled nor checked.

–with-fxt=prefix  Search for FxT under prefix. FxT (http://savannah.nongnu.org/projects/fkt) is used to generate traces of scheduling events, which can then be rendered them using VITE (Off-line Performance Feedback). prefix should notably contain include/fxt/fxt.h.

–with-perf-model-dir=dir  Store performance models under dir, instead of the current user’s home.

–with-goto-dir=prefix  Search for GotoBLAS under prefix, which should notably contain libgoto.so or libgoto2.so.

–with-atlas-dir=prefix  Search for ATLAS under prefix, which should notably contain include/cblas.h.

–with-mkl-cflags=cflags  Use cflags to compile code that uses the MKL library.

–with-mkl-ldflags=ldflags  Use ldflags when linking code that uses the MKL library. Note that the MKL website (http://software.intel.com/en-us/articles/intel-mkl-link-line-advisor/) provides a script to determine the linking flags.

–disable-glpk  Disable the use of libglpk for computing area bounds.

–disable-build-tests  Disable the build of tests.

–disable-build-examples  Disable the build of examples.

–disable-build-tests  Disable the build of tests.

–enable-sc-hypervisor  Enable the Scheduling Context Hypervisor plugin (Scheduling Context Hypervisor). By default, it is disabled.

–enable-memory-stats  Enable memory statistics (Memory Feedback).

–enable-simgrid  Enable simulation of execution in simgrid, to allow easy experimentation with various numbers of cores and GPUs, or amount of memory, etc. Experimental.

The path to simgrid can be specified through the SIMGRID_CFLAGS and SIMGRID_LIBS environment variables, for instance:

```bash
export SIMGRID_CFLAGS="-I/usr/local/simgrid/include"
export SIMGRID_LIBS="-L/usr/local/simgrid/lib -lsimgrid"
```
--with-simgrid-dir  Similar to the option --enable-simgrid but also allows to specify the location to the SimGrid library.

--with-simgrid-include-dir  Similar to the option --enable-simgrid but also allows to specify the location to the SimGrid include directory.

--with-simgrid-lib-dir  Similar to the option --enable-simgrid but also allows to specify the location to the SimGrid lib directory.

--with-smpirun=path  Use the smpirun at path

--enable-simgrid-mc  Enable the Model Checker in simulation of execution in simgrid, to allow exploring various execution paths.

--enable-calibration-heuristic  Allows to set the maximum authorized percentage of deviation for the history-based calibrator of StarPU. A correct value of this parameter must be in [0..100]. The default value of this parameter is 10. Experimental.

Module Documentation a.k.a StarPU’s API

29.1 Versioning

Macros

- `#define STARPU_MAJOR_VERSION`
- `#define STARPU_MINOR_VERSION`
- `#define STARPU_RELEASE_VERSION`

Functions

- `void starpu_get_version (int *major, int *minor, int *release)`

29.1.1 Detailed Description

29.1.2 Macro Definition Documentation

29.1.2.1 STARPU_MAJOR_VERSION

`#define STARPU_MAJOR_VERSION`
Define the major version of StarPU. This is the version used when compiling the application.

29.1.2.2 STARPU_MINOR_VERSION

`#define STARPU_MINOR_VERSION`
Define the minor version of StarPU. This is the version used when compiling the application.

29.1.2.3 STARPU_RELEASE_VERSION

`#define STARPU_RELEASE_VERSION`
Define the release version of StarPU. This is the version used when compiling the application.

29.1.3 Function Documentation

29.1.3.1 starpu_get_version()

`void starpu_get_version (`
`    int * major,`
`    int * minor,`
`    int * release )`  
Return as 3 integers the version of StarPU used when running the application.
29.2 Initialization and Termination

Data Structures

- struct starpu_conf

Functions

- int starpu_init (struct starpu_conf *conf) STARPU_WARN_UNUSED_RESULT
- int starpu_initialize (struct starpu_conf *user_conf, int *argc, char ***argv)
- int starpu_conf_init (struct starpu_conf *conf)
- int starpu_is_initialized (void)
- void starpu_shutdown (void)
- void starpu_pause (void)
- void starpu_resume (void)
- int starpu_asynchronous_copy_disabled (void)
- int starpu_asynchronous_cuda_copy_disabled (void)
- int starpu_asynchronous_opencl_copy_disabled (void)
- int starpu_asynchronous_mic_copy_disabled (void)
- int starpu_asynchronous_mpi_ms_copy_disabled (void)
- void starpu_topology_print (FILE *f)

29.2.1 Detailed Description

29.2.2 Data Structure Documentation

29.2.2.1 struct starpu_conf

This structure is passed to the starpu_init() function in order to configure StarPU. It has to be initialized with starpu_conf_init(). When the default value is used, StarPU automatically selects the number of processing units and takes the default scheduling policy. The environment variables overwrite the equivalent parameters.

Data Fields

- int magic
- const char * sched_policy_name
- struct starpu_sched_policy * sched_policy
- void(* sched_policy_init )(unsigned)(unsigned)
- int ncpus
- int ncuda
- int nopencl
- int nmic
- int nscc
- int nmpi_ms
- unsigned use_explicit_workers_bindid
- unsigned workers_bindid [STARPU_NMAXWORKERS]
- unsigned use_explicit_workers_cuda_gpusid
- unsigned workers_cuda_gpusid [STARPU_NMAXWORKERS]
- unsigned use_explicit_workers_opencl_gpusid
- unsigned workers_opencl_gpusid [STARPU_NMAXWORKERS]
- unsigned use_explicit_workers_mic_deviceid
- unsigned workers_mic_deviceid [STARPU_NMAXWORKERS]
- unsigned use_explicit_workers_scc_deviceid
- unsigned workers_scc_deviceid [STARPU_NMAXWORKERS]
- unsigned use_explicit_workers_mpi_ms_deviceid
- unsigned workers_mpi_ms_deviceid [STARPU_NMAXWORKERS]
- int bus_calibrate
29.2 Initialization and Termination

- int calibrate
- int single_combined_worker
- char * mic_sink_program_path
- int disable_asynchronous_copy
- int disable_asynchronous_cuda_copy
- int disable_asynchronous_opencl_copy
- int disable_asynchronous_mic_copy
- int disable_asynchronous_mpi_ms_copy
- unsigned * cuda_opengl_interoperability
- unsigned n_cuda_opengl_interoperability
- struct starpu_driver * not_launched_drivers
- unsigned n_not_launched_drivers
- unsigned trace_buffer_size
- int global_sched_ctx_min_priority
- int global_sched_ctx_max_priority

29.2.2.1.1 Field Documentation

29.2.2.1.1.1 magic

int starpu_conf::magic
Will be initialized by starpu_conf_init(). Should not be set by hand.

29.2.2.1.1.2 sched_policy_name

const char * starpu_conf::sched_policy_name
Name of the scheduling policy. This can also be specified with the environment variable STARPU_SCHED. (default = NULL).

29.2.2.1.1.3 sched_policy

struct starpu_sched_policy * starpu_conf::sched_policy
Definition of the scheduling policy. This field is ignored if starpu_conf::sched_policy_name is set. (default = NULL)

29.2.2.1.1.4 sched_policy_init

void (* starpu_conf::sched_policy_init)(unsigned)
todo

29.2.2.1.1.5 ncpus

int starpu_conf::ncpus
Number of CPU cores that StarPU can use. This can also be specified with the environment variable STARPU←NCPU . (default = -1)

29.2.2.1.1.6 ncuda

int starpu_conf::ncuda
Number of CUDA devices that StarPU can use. This can also be specified with the environment variable STARPU←U_NCUDA . (default = -1)

29.2.2.1.1.7 nopencl

int starpu_conf::nopencl
Number of OpenCL devices that StarPU can use. This can also be specified with the environment variable STAR←RPU_NOPENCL . (default = -1)

29.2.2.1.1.8 nmic

int starpu_conf::nmic
Number of MIC devices that StarPU can use. This can also be specified with the environment variable STAR←_NMIC . (default = -1)

29.2.2.1.1.9 nscc

int starpu_conf::nscc
Number of SCC devices that StarPU can use. This can also be specified with the environment variable STAR←_NSCC . (default = -1)
29.2.2.1.10  nmpi_ms

int starpu_conf::nmpi_ms
Number of MPI Master Slave devices that StarPU can use. This can also be specified with the environment variable STARPU_NMPI_MS. (default = -1)

29.2.2.1.11  use_explicit_workers_bindid

unsigned starpu_conf::use_explicit_workers_bindid
If this flag is set, the starpu_conf:: workers_bindid array indicates where the different workers are bound, otherwise StarPU automatically selects where to bind the different workers. This can also be specified with the environment variable STARPU_WORKERS_CPUID. (default = 0)

29.2.2.1.12  workers_bindid

unsigned starpu_conf::workers_bindid[STARPU_NMAXWORKERS]
If the starpu_conf:: use_explicit_workers_bindid flag is set, this array indicates where to bind the different workers. The i-th entry of the starpu_conf:: workers_bindid indicates the logical identifier of the processor which should execute the i-th worker. Note that the logical ordering of the CPUs is either determined by the OS, or provided by the hwloc library in case it is available.

29.2.2.1.13  use_explicit_workers_cuda_gpuid

unsigned starpu_conf::use_explicit_workers_cuda_gpuid
If this flag is set, the CUDA workers will be attached to the CUDA devices specified in the starpu_conf:: workers_cuda_gpuid array. Otherwise, StarPU affects the CUDA devices in a round-robin fashion. This can also be specified with the environment variable STARPU_WORKERS_CUDAID. (default = 0)

29.2.2.1.14  workers_cuda_gpuid

unsigned starpu_conf::workers_cuda_gpuid[STARPU_NMAXWORKERS]
If the starpu_conf:: use_explicit_workers_cuda_gpuid flag is set, this array contains the logical identifiers of the CUDA devices (as used by cudaGetDevice()).

29.2.2.1.15  use_explicit_workers_opencl_gpuid

unsigned starpu_conf::use_explicit_workers_opencl_gpuid
If this flag is set, the OpenCL workers will be attached to the OpenCL devices specified in the starpu_conf:: workers_opencl_gpuid array. Otherwise, StarPU affects the OpenCL devices in a round-robin fashion. This can also be specified with the environment variable STARPU_WORKERS_OPENCLID. (default = 0)

29.2.2.1.16  workers_opencl_gpuid

unsigned starpu_conf::workers_opencl_gpuid[STARPU_NMAXWORKERS]
If the starpu_conf:: use_explicit_workers_opencl_gpuid flag is set, this array contains the logical identifiers of the OpenCL devices to be used.

29.2.2.1.17  use_explicit_workers_mic_deviceid

unsigned starpu_conf::use_explicit_workers_mic_deviceid
If this flag is set, the MIC workers will be attached to the MIC devices specified in the array starpu_conf:: workers_mic_deviceid. Otherwise, StarPU affects the MIC devices in a round-robin fashion. This can also be specified with the environment variable STARPU_WORKERS_MICID. (default = 0)

29.2.2.1.18  workers_mic_deviceid

unsigned starpu_conf::workers_mic_deviceid[STARPU_NMAXWORKERS]
If the flag starpu_conf:: use_explicit_workers_mic_deviceid is set, the array contains the logical identifiers of the MIC devices to be used.

29.2.2.1.19  use_explicit_workers_scc_deviceid

unsigned starpu_conf::use_explicit_workers_scc_deviceid
If this flag is set, the SCC workers will be attached to the SCC devices specified in the array starpu_conf:: workers_scc_deviceid. (default = 0)

29.2.2.1.20  workers_scc_deviceid

unsigned starpu_conf::workers_scc_deviceid[STARPU_NMAXWORKERS]
If the flag starpu_conf:: use_explicit_workers_scc_deviceid is set, the array contains the logical identifiers of the SCC devices to be used. Otherwise, StarPU affects the SCC devices in a round-robin fashion. This can also be specified...
29.2 Initialization and Termination

With the environment variable `STARPU_WORKERS_SCCID`.

29.2.2.1.1.21 use_explicit_workers_mpi_ms_deviceid

```cpp
unsigned starpu_conf::use_explicit_workers_mpi_ms_deviceid
```

If this flag is set, the MPI Master Slave workers will be attached to the MPI Master Slave devices specified in the array `starpu_conf::workers_mpi_ms_deviceid`. Otherwise, StarPU affects the MPI Master Slave devices in a round-robin fashion. (default = 0)

29.2.2.1.1.22 workers_mpi_ms_deviceid

```cpp
unsigned starpu_conf::workers_mpi_ms_deviceid[STARPU_NMAXWORKERS]
```

If the flag `starpu_conf::use_explicit_workers_mpi_ms_deviceid` is set, the array contains the logical identifiers of the MPI Master Slave devices to be used.

29.2.2.1.1.23 bus_calibrate

```cpp
int starpu_conf::bus_calibrate
```

If this flag is set, StarPU will recalibrate the bus. If this value is equal to -1, the default value is used. This can also be specified with the environment variable `STARPU_BUS_CALIBRATE`. (default = 0)

29.2.2.1.1.24 calibrate

```cpp
int starpu_conf::calibrate
```

If this flag is set, StarPU will calibrate the performance models when executing tasks. If this value is equal to -1, the default value is used. If the value is equal to 1, it will force continuing calibration. If the value is equal to 2, the existing performance models will be overwritten. This can also be specified with the environment variable `STARPU_CALIBRATE`. (default = 0)

29.2.2.1.1.25 single_combined_worker

```cpp
int starpu_conf::single_combined_worker
```

By default, StarPU executes parallel tasks concurrently. Some parallel libraries (e.g. most OpenMP implementations) however do not support concurrent calls to parallel code. In such case, setting this flag makes StarPU only start one parallel task at a time (but other CPU and GPU tasks are not affected and can be run concurrently). The parallel task scheduler will however still try varying combined worker sizes to look for the most efficient ones. This can also be specified with the environment variable `STARPU_SINGLE_COMBINED_WORKER`. (default = 0)

29.2.2.1.1.26 mic_sink_program_path

```cpp
char * starpu_conf::mic_sink_program_path
```

Path to the kernel to execute on the MIC device, compiled for MIC architecture. When set to `NULL`, StarPU automatically looks next to the host program location. (default = `NULL`)

29.2.2.1.1.27 disable_asynchronous_copy

```cpp
int starpu_conf::disable_asynchronous_copy
```

This flag should be set to 1 to disable asynchronous copies between CPUs and all accelerators. This can also be specified with the environment variable `STARPU_DISABLEASYNCHRONOUS_COPY`. The AMD implementation of OpenCL is known to fail when copying data asynchronously. When using this implementation, it is therefore necessary to disable asynchronous data transfers. This can also be specified at compilation time by giving to the configure script the option `--disable-asynchronous-copy`. (default = 0)

29.2.2.1.1.28 disable_asynchronous_cuda_copy

```cpp
int starpu_conf::disable_asynchronous_cuda_copy
```

This flag should be set to 1 to disable asynchronous copies between CPUs and CUDA accelerators. This can also be specified with the environment variable `STARPU_DISABLEASYNCHRONOUS_CUDA_COPY`. This can also be specified at compilation time by giving to the configure script the option `--disable-asynchronous-cuda-copy`. (default = 0)

29.2.2.1.1.29 disable_asynchronous_opencl_copy

```cpp
int starpu_conf::disable_asynchronous_opencl_copy
```

This flag should be set to 1 to disable asynchronous copies between CPUs and OpenCL accelerators. This can also be specified with the environment variable `STARPU_DISABLEASYNCHRONOUS_OPENCL_COPY`. The AMD implementation of OpenCL is known to fail when copying data asynchronously. When using this implementation, it is therefore necessary to disable asynchronous data transfers. This can also be specified at compilation time by giving to the configure script the option `--disable-asynchronous-opencl-copy`. (default = 0)
29.2.2.1.30 disable_asynchronous_mic_copy

int starpu_conf::disable_asynchronous_mic_copy
This flag should be set to 1 to disable asynchronous copies between CPUs and MIC accelerators. This can also be specified with the environment variable STARPU_DISABLEASYNCHRONOUS_MIC_COPY. This can also be specified at compilation time by giving to the configure script the option --disable-asynchronous-mic-copy. (default = 0).

29.2.2.1.31 disable_asynchronous_mpi_ms_copy

int starpu_conf::disable_asynchronous_mpi_ms_copy
This flag should be set to 1 to disable asynchronous copies between CPUs and MPI Master Slave devices. This can also be specified with the environment variable STARPU_DISABLEASYNCHRONOUS_MPI_MS_COPY. This can also be specified at compilation time by giving to the configure script the option --disable-asynchronous-mpi-master-slave-copy. (default = 0).

29.2.2.1.32 cuda_opengl_interoperability

unsigned ∗ starpu_conf::cuda_opengl_interoperability
Enable CUDA/OpenGL interoperation on these CUDA devices. This can be set to an array of CUDA device identifiers for which cudaGLSetGLDevice() should be called instead of cudaSetDevice(). Its size is specified by the starpu_conf::n_cuda_opengl_interoperability field below (default = NULL)

29.2.2.1.33 n_cuda_opengl_interoperability

unsigned starpu_conf::n_cuda_opengl_interoperability
todo

29.2.2.1.34 not_launched_drivers

struct starpu_driver ∗ starpu_conf::not_launched_drivers
Array of drivers that should not be launched by StarPU. The application will run in one of its own threads. (default = NULL)

29.2.2.1.35 n_not_launched_drivers

unsigned starpu_conf::n_not_launched_drivers
The number of StarPU drivers that should not be launched by StarPU. (default = 0)

29.2.2.1.36 trace_buffer_size

starpu_conf::trace_buffer_size
Specify the buffer size used for FxT tracing. Starting from FxT version 0.2.12, the buffer will automatically be flushed when it fills in, but it may still be interesting to specify a bigger value to avoid any flushing (which would disturb the trace).

29.2.2.1.37 global_sched_ctx_min_priority

starpu_conf::global_sched_ctx_min_priority
todo

29.2.2.1.38 global_sched_ctx_max_priority

starpu_conf::global_sched_ctx_max_priority
todo

29.2.3 Function Documentation

29.2.3.1 starpu_init()

int starpu_init ( struct starpu_conf ∗ conf )
This is StarPU initialization method, which must be called prior to any other StarPU call. It is possible to specify StarPU's configuration (e.g. scheduling policy, number of cores, ...) by passing a non-NULL conf. Default configuration is used if conf is NULL. Upon successful completion, this function returns 0. Otherwise, -ENODEV indicates that no worker was available (and thus StarPU was not initialized).
29.2 Initialization and Termination

29.2.3.2 starpu_initialize()

```c
int starpu_initialize (struct starpu_conf * user_conf,
int * argc,
char *** argv )
```

This is the same as `starpu_init()`, but also takes the `argc` and `argv` as defined by the application. This is needed for SCC execution to initialize the communication library. Do not call `starpu_init()` and `starpu_initialize()` in the same program.

29.2.3.3 starpu_conf_init()

```c
int starpu_conf_init (struct starpu_conf * conf )
```

Initialize the `conf` structure with the default values. In case some configuration parameters are already specified through environment variables, `starpu_conf_init()` initializes the fields of `conf` according to the environment variables. For instance if `STARPU_CALIBRATE` is set, its value is put in the field `starpu_conf::calibrate` of `conf`. Upon successful completion, this function returns 0. Otherwise, `-EINVAL` indicates that the argument was `NULL`.

29.2.3.4 starpu_is_initialized()

```c
int starpu_is_initialized ( void )
```

Return 1 if StarPU is already initialized.

29.2.3.5 starpu_shutdown()

```c
void starpu_shutdown ( void )
```

This is StarPU termination method. It must be called at the end of the application: statistics and other post-mortem debugging information are not guaranteed to be available until this method has been called.

29.2.3.6 starpu_pause()

```c
void starpu_pause ( void )
```

Suspend the processing of new tasks by workers. It can be used in a program where StarPU is used during only a part of the execution. Without this call, the workers continue to poll for new tasks in a tight loop, wasting CPU time. The symmetric call to `starpu_resume()` should be used to unfreeze the workers.

29.2.3.7 starpu_resume()

```c
void starpu_resume ( void )
```

This is the symmetrical call to `starpu_pause()`, used to resume the workers polling for new tasks.

29.2.3.8 starpu_asynchronous_copy_disabled()

```c
int starpu_asynchronous_copy_disabled ( void )
```

Return 1 if asynchronous data transfers between CPU and accelerators are disabled.

29.2.3.9 starpu_asynchronous_cuda_copy_disabled()

```c
int starpu_asynchronous_cuda_copy_disabled ( void )
```

Return 1 if asynchronous data transfers between CPU and CUDA accelerators are disabled.
29.2.3.10 starpu_asynchronous_opencl_copy_disabled()

int starpu_asynchronous_opencl_copy_disabled (  
    void )  
Return 1 if asynchronous data transfers between CPU and OpenCL accelerators are disabled.

29.2.3.11 starpu_asynchronous_mic_copy_disabled()

int starpu_asynchronous_mic_copy_disabled (  
    void )  
Return 1 if asynchronous data transfers between CPU and MIC devices are disabled.

29.2.3.12 starpu_asynchronous_mpi_ms_copy_disabled()

int starpu_asynchronous_mpi_ms_copy_disabled (  
    void )  
Return 1 if asynchronous data transfers between CPU and MPI Slave devices are disabled.

29.2.3.13 starpu_topology_print()

void starpu_topology_print (  
    FILE * f )  
Print a description of the topology on f.

29.3 Standard Memory Library

Macros

• #define starpu_data_malloc_pinned_if_possible
• #define starpu_data_free_pinned_if_possible
• #define STARPU_MALLOC_PINNED
• #define STARPU_MALLOC_COUNT
• #define STARPU_MALLOC_NORECLAIM
• #define STARPU_MALLOC_SIMULATION_FOLDED
• #define STARPU_MEMORY_WAIT
• #define STARPU_MEMORY_OVERFLOW

Functions

• int starpu_malloc_flags (void **A, size_t dim, int flags) STARPU_ATTRIBUTE_ALLOC_SIZE(2)
• void starpu_malloc_set_align (size_t align)
• int starpu_malloc (void **A, size_t dim) STARPU_ATTRIBUTE_ALLOC_SIZE(2)
• int starpu_free (void *A)
• int starpu_free_flags (void *A, size_t dim, int flags)
• int starpu_memory_pin (void *addr, size_t size)
• int starpu_memory_unpin (void *addr, size_t size)
• starpu_ssize_t starpu_memory_get_total (unsigned node)
• starpu_ssize_t starpu_memory_get_total_all_nodes ()
• starpu_ssize_t starpu_memory_get_available (unsigned node)
• starpu_ssize_t starpu_memory_get_available_all_nodes ()
• int starpu_memory_allocate (unsigned node, size_t size, int flags)
• void starpu_memory_deallocate (unsigned node, size_t size)
• void starpu_memory_wait_available (unsigned node, size_t size)

29.3.1 Detailed Description

29.3.2 Macro Definition Documentation
29.3.2.1  starpu_data_malloc_pinned_if_possible

#define starpu_data_malloc_pinned_if_possible

_Deprecated_ Equivalent to `starpu_malloc()`. This macro is provided to avoid breaking old codes.

29.3.2.2  starpu_data_free_pinned_if_possible

#define starpu_data_free_pinned_if_possible

_Deprecated_ Equivalent to `starpu_free()`. This macro is provided to avoid breaking old codes.

29.3.2.3  STARPU_MALLOC_PINNED

#define STARPU_MALLOC_PINNED

Value passed to the function `starpu_malloc_flags()` to indicate the memory allocation should be pinned.

29.3.2.4  STARPU_MALLOC_COUNT

#define STARPU_MALLOC_COUNT

Value passed to the function `starpu_malloc_flags()` to indicate the memory allocation should be in the limit defined by the environment variables `STARPU_LIMIT_CUDA_devid_MEM`, `STARPU_LIMIT_CUDA_MEM`, `STARPU_LIMIT_OPENCL_devid_MEM`, `STARPU_LIMIT_OPENCL_MEM` and `STARPU_LIMIT_CPU_MEM` (see Section _How to Limit Memory Used By StarPU And Cache Buffer Allocations_). If no memory is available, it tries to reclaim memory from StarPU. Memory allocated this way needs to be freed by calling the function `starpu_free_flags()` with the same flag.

29.3.2.5  STARPU_MALLOC_NORECLAIM

#define STARPU_MALLOC_NORECLAIM

Value passed to the function `starpu_malloc_flags()` along `STARPU_MALLOC_COUNT` to indicate that while the memory allocation should be kept in the limits defined for `STARPU_MALLOC_COUNT`, no reclaiming should be performed by `starpu_malloc_flags()` itself, thus potentially overflowing the memory node a bit. StarPU will reclaim memory after next task termination, according to the `STARPU_MINIMUM_AVAILABLE_MEM`, `STARPU_TARGET_AVAILABLE_MEM`, `STARPU_MINIMUM_CLEAN_BUFFERS`, and `STARPU_TARGET_CLEAN_BUFFERS` environment variables. If `STARPU_MEMORY_WAIT` is set, no overflowing will happen, `starpu_malloc_flags()` will wait for other eviction mechanisms to release enough memory.

29.3.2.6  STARPU_MALLOC_SIMULATION_FOLDED

#define STARPU_MALLOC_SIMULATION_FOLDED

Value passed to the function `starpu_malloc_flags()` to indicate that when StarPU is using simgrid, the allocation can be "folded", i.e. a memory area is allocated, but its content is actually a replicate of the same memory area, to avoid having to actually allocate that much memory. This thus allows to have a memory area that does not actually consumes memory, to which one can read from and write to normally, but get bogus values.

29.3.2.7  STARPU_MEMORY_WAIT

#define STARPU_MEMORY_WAIT

Value passed to `starpu_memory_allocate()` to specify that the function should wait for the requested amount of memory to become available, and atomically allocate it.

29.3.2.8  STARPU_MEMORY_OVERFLOW

#define STARPU_MEMORY_OVERFLOW

Value passed to `starpu_memory_allocate()` to specify that the function should allocate the amount of memory, even if that means overflowing the total size of the memory node.

Generated by Doxygen
29.3.3 Function Documentation

29.3.3.1 starpu_malloc_flags()

```c
int starpu_malloc_flags ( void ** A, size_t dim, int flags )
```

Perform a memory allocation based on the constraints defined by the given flag.

29.3.3.2 starpu_malloc_set_align()

```c
void starpu_malloc_set_align ( size_t align )
```

Set an alignment constraints for starpu_malloc() allocations. align must be a power of two. This is for instance called automatically by the OpenCL driver to specify its own alignment constraints.

29.3.3.3 starpu_malloc()

```c
int starpu_malloc ( void ** A, size_t dim )
```

Allocate data of the given size `dim` in main memory, and return the pointer to the allocated data through `A`. It will also try to pin it in CUDA or OpenCL, so that data transfers from this buffer can be asynchronous, and thus permit data transfer and computation overlapping. The allocated buffer must be freed thanks to the starpu_free() function.

29.3.3.4 starpu_free()

```c
int starpu_free ( void * A )
```

Free memory which has previously been allocated with starpu_malloc().

29.3.3.5 starpu_free_flags()

```c
int starpu_free_flags ( void * A, size_t dim, int flags )
```

Free memory by specifying its size. The given flags should be consistent with the ones given to starpu_malloc() when allocating the memory.

29.3.3.6 starpu_memory_pin()

```c
int starpu_memory_pin ( void * addr, size_t size )
```

Pin the given memory area, so that CPU-GPU transfers can be done asynchronously with DMAs. The memory must be unpinned with starpu_memory_unpin() before being freed. Returns 0 on success, -1 on error.

29.3.3.7 starpu_memory_unpin()

```c
int starpu_memory_unpin ( void * addr, size_t size )
```

Unpin the given memory area previously pinned with starpu_memory_pin(). Returns 0 on success, -1 on error.
29.3.3.8  \texttt{starpu\_memory\_get\_total()}

\begin{verbatim}
ssize_t starpu_memory_get_total ( unsigned node )
\end{verbatim}

If a memory limit is defined on the given node (see Section \texttt{How to Limit Memory Used By StarPU And Cache Buffer Allocations}), return the amount of total memory on the node. Otherwise return -1.

29.3.3.9  \texttt{starpu\_memory\_get\_total\_all\_nodes()}

\begin{verbatim}
ssize_t starpu_memory_get_total_all_nodes ( )
\end{verbatim}

Return the amount of total memory on all memory nodes for whose a memory limit is defined (see Section \texttt{How to Limit Memory Used By StarPU And Cache Buffer Allocations}).

29.3.3.10  \texttt{starpu\_memory\_get\_available()}

\begin{verbatim}
ssize_t starpu_memory_get_available ( unsigned node )
\end{verbatim}

If a memory limit is defined on the given node (see Section \texttt{How to Limit Memory Used By StarPU And Cache Buffer Allocations}), return the amount of available memory on the node. Otherwise return -1.

29.3.3.11  \texttt{starpu\_memory\_get\_available\_all\_nodes()}

\begin{verbatim}
ssize_t starpu_memory_get_available_all_nodes ( )
\end{verbatim}

Return the amount of available memory on all memory nodes for whose a memory limit is defined (see Section \texttt{How to Limit Memory Used By StarPU And Cache Buffer Allocations}).

29.3.3.12  \texttt{starpu\_memory\_allocate()}

\begin{verbatim}
int starpu_memory_allocate ( unsigned node, size_t size, int flags )
\end{verbatim}

If a memory limit is defined on the given node (see Section \texttt{How to Limit Memory Used By StarPU And Cache Buffer Allocations}), try to allocate some of it. This does not actually allocate memory, but only accounts for it. This can be useful when the application allocates data another way, but want StarPU to be aware of the allocation size e.g. for memory reclaiming. By default, the function returns -ENOMEM if there is not enough room on the given node. \texttt{flags} can be either \texttt{STARPU\_MEMORY\_WAIT} or \texttt{STARPU\_MEMORY\_OVERFLOW} to change this.

29.3.3.13  \texttt{starpu\_memory\_deallocate()}

\begin{verbatim}
void starpu_memory_deallocate ( unsigned node, size_t size )
\end{verbatim}

If a memory limit is defined on the given node (see Section \texttt{How to Limit Memory Used By StarPU And Cache Buffer Allocations}), free some of it. This does not actually free memory, but only accounts for it, like \texttt{starpu_memory\_allocate()}. The amount does not have to be exactly the same as what was passed to \texttt{starpu_memory\_allocate()}, only the eventual amount needs to be the same, i.e. one call to \texttt{starpu_memory\_allocate()} can be followed by several calls to \texttt{starpu_memory\_deallocate()} to declare the deallocation piece by piece.

29.3.3.14  \texttt{starpu\_memory\_wait\_available()}

\begin{verbatim}
void starpu_memory_wait_available ( unsigned node, size_t size )
\end{verbatim}

If a memory limit is defined on the given node (see Section \texttt{How to Limit Memory Used By StarPU And Cache Buffer Allocations}), this will wait for \texttt{size} bytes to become available on \texttt{node}. Of course, since another thread may be allocating memory concurrently, this does not necessarily mean that this amount will be actually available, just that it was reached. To atomically wait for some amount of memory and reserve it, \texttt{starpu_memory\_allocate()} should be used with the \texttt{STARPU\_MEMORY\_WAIT} flag.
29.4 Toolbox

The following macros allow to make GCC extensions portable, and to have a code which can be compiled with any C compiler.

**Macros**

- `#define STARPU_GNUC_PREREQ(maj, min)`
- `#define STARPU_UNLIKELY(expr)`
- `#define STARPU_LIKELY(expr)`
- `#define STARPU_ATTRIBUTE_UNUSED`
- `#define STARPU_ATTRIBUTE_INTERNAL`
- `#define STARPU_ATTRIBUTE_MALLOC`
- `#define STARPU_ATTRIBUTE_WARN_UNUSED_RESULT`
- `#define STARPU_ATTRIBUTEPURE`
- `#define STARPU_ATTRIBUTEAligned(size)`
- `#define STARPU_WARN_UNUSED_RESULT`
- `#define STARPU_POISON_PTR`
- `#define STARPU_MIN(a, b)`
- `#define STARPU_MAX(a, b)`
- `#define STARPU_ASSERT(x)`
- `#define STARPU_ASSERT_MSG(x, msg, ...)`
- `#define STARPU_ABORT()`
- `#define STARPU_ABORT_MSG(msg, ...)`
- `#define STARPU_CHECK_RETURN_VALUE(err, message, ...)`
- `#define STARPU_CHECK_RETURN_VALUE_IS(err, value, message, ...)`
- `#define STARPU_RMB()`
- `#define STARPU_WMB()`

**Functions**

- `static __starpu_inline int starpu_get_env_number (const char *str)`

29.4.1 Detailed Description

The following macros allow to make GCC extensions portable, and to have a code which can be compiled with any C compiler.

29.4.2 Macro Definition Documentation

29.4.2.1 STARPU_GNUC_PREREQ

```c
#define STARPU_GNUC_PREREQ(maj, min)
```

Return true (non-zero) if GCC version `maj.min` or later is being used (macro taken from glibc.)

29.4.2.2 STARPU_UNLIKELY

```c
#define STARPU_UNLIKELY(expr)
```

When building with a GNU C Compiler, allow programmers to mark an expression as unlikely.
29.4 Toolbox

29.4.2.3 STARPU_LIKELY

#define STARPU_LIKELY(expr)
When building with a GNU C Compiler, allow programmers to mark an expression as likely.

29.4.2.4 STARPU_ATTRIBUTE_UNUSED

#define STARPU_ATTRIBUTE_UNUSED
When building with a GNU C Compiler, defined to __attribute__((unused))

29.4.2.5 STARPU_ATTRIBUTE_INTERNAL

#define STARPU_ATTRIBUTE_INTERNAL
When building with a GNU C Compiler, defined to __attribute__((visibility("internal")))

29.4.2.6 STARPU_ATTRIBUTE_MALLOC

#define STARPU_ATTRIBUTE_MALLOC
When building with a GNU C Compiler, defined to __attribute__((malloc))

29.4.2.7 STARPU_ATTRIBUTE_WARN_UNUSED_RESULT

#define STARPU_ATTRIBUTE_WARN_UNUSED_RESULT
When building with a GNU C Compiler, defined to __attribute__((warn_unused_result))

29.4.2.8 STARPU_ATTRIBUTE_PURE

#define STARPU_ATTRIBUTE_PURE
When building with a GNU C Compiler, defined to __attribute__((pure))

29.4.2.9 STARPU_ATTRIBUTE_ALIGNED

#define STARPU_ATTRIBUTE_ALIGNED(size)
When building with a GNU C Compiler, defined to __attribute__((aligned(size)))

29.4.2.10 STARPU_WARN_UNUSED_RESULT

#define STARPU_WARN_UNUSED_RESULT
When building with a GNU C Compiler, defined to __attribute__((warn_unused_result))

29.4.2.11 STARPU_POISON_PTR

#define STARPU_POISON_PTR
Define a value which can be used to mark pointers as invalid values.

29.4.2.12 STARPU_MIN

#define STARPU_MIN(a, b)
Return the min of the two parameters.

29.4.2.13 STARPU_MAX

#define STARPU_MAX(a, b)
Return the max of the two parameters.
29.4.2.14 STARPU_ASSERT

#define STARPU_ASSERT(x)

Unless StarPU has been configured with the option --enable-fast, this macro will abort if the expression is false.

29.4.2.15 STARPU_ASSERT_MSG

#define STARPU_ASSERT_MSG(x, msg, ...)

Unless StarPU has been configured with the option --enable-fast, this macro will abort if the expression is false. The given message will be displayed.

29.4.2.16 STARPU_ABORT

#define STARPU_ABORT()

Abort the program.

29.4.2.17 STARPU_ABORT_MSG

#define STARPU_ABORT_MSG(msg, ...)

Abort the program, and display the given message.

29.4.2.18 STARPU_CHECK_RETURN_VALUE

#define STARPU_CHECK_RETURN_VALUE(err, message, ...)

Abort the program (after displaying message) if err has a value which is not 0.

29.4.2.19 STARPU_CHECK_RETURN_VALUE_IS

#define STARPU_CHECK_RETURN_VALUE_IS(err, value, message, ...)

Abort the program (after displaying message) if err is different from value.

29.4.2.20 STARPU_RMB

#define STARPU_RMB()

This macro can be used to do a synchronization.

29.4.2.21 STARPU_WMB

#define STARPU_WMB()

This macro can be used to do a synchronization.

29.4.3 Function Documentation
29.4.3.1 starpu_get_env_number()

int starpu_get_env_number (const char *str) [static]

Return the integer value of the environment variable named str. Return 0 otherwise (the variable does not exist or has a non-integer value).

29.5 Threads

This section describes the thread facilities provided by StarPU. The thread function are either implemented on top of the pthread library or the Simgrid library when the simulated performance mode is enabled (SimGrid Support).

Macros

- #define STARPU_PTHREAD_CREATE_ON(name, thread, attr, routine, arg, where)
- #define STARPU_PTHREAD_CREATE(thread, attr, routine, arg)
- #define STARPU_PTHREAD_MUTEX_INIT(mutex, attr)
- #define STARPU_PTHREAD_MUTEX_DESTROY(mutex)
- #define STARPU_PTHREAD_MUTEX_LOCK(mutex)
- #define STARPU_PTHREAD_MUTEX_UNLOCK(mutex)
- #define STARPU_PTHREAD_KEY_CREATE(key, destr)
- #define STARPU_PTHREAD_KEY_DELETE(key)
- #define STARPU_PTHREAD_SETSPECIFIC(key, ptr)
- #define STARPU_PTHREAD_GETSPECIFIC(key)
- #define STARPU_PTHREAD_RWLOCK_INIT(rwlock, attr)
- #define STARPU_PTHREAD_RWLOCK_RDLOCK(rwlock)
- #define STARPU_PTHREAD_RWLOCK_WRLOCK(rwlock)
- #define STARPU_PTHREAD_RWLOCK_UNLOCK(rwlock)
- #define STARPU_PTHREAD_RWLOCKDESTROY(rwlock)
- #define STARPU_PTHREAD_COND_INIT(cond, attr)
- #define STARPU_PTHREAD_COND_DESTROY(cond)
- #define STARPU_PTHREAD_COND_SIGNAL(cond)
- #define STARPU_PTHREAD_COND_BROADCAST(cond)
- #define STARPU_PTHREAD_COND_WAIT(cond, mutex)
- #define STARPU_PTHREAD_BARRIER_INIT(barrier, attr, count)
- #define STARPU_PTHREAD_BARRIER_DESTROY(barrier)
- #define STARPU_PTHREAD_BARRIER_WAIT(barrier)
- #define STARPU_PTHREAD_MUTEX_INITIALIZER
- #define STARPU_PTHREAD_COND_INITIALIZER

Functions

- int starpu_pthread_create (starpu_thread_t *thread, const starpu_thread_attr_t *attr, void *(*startşe-
  routine)(void *), void *arg)
- int starpu_pthread_join (starpu_thread_t thread, void **retval)
- int starpu_pthread_exit (void *retval) STARPU_ATTRIBUTE_NORETURN
- int starpu_pthread_attr_init (starpu_thread_attr_t *attr)
- int starpu_pthread_attr_destroy (starpu_thread_attr_t *attr)
- int starpu_pthread_attr_setdetachstate (starpu_thread_attr_t *attr, int detachstate)
- int starpu_pthread_mutex_init (starpu_thread_mutex_t *mutex, const starpu_thread_mutexattr_t *mutexattr)
- int starpu_pthread_mutex_destroy (starpu_thread_mutex_t *mutex)
- int starpu_pthread_mutex_lock (starpu_thread_mutex_t *mutex)
- int starpu_pthread_mutex_unlock (starpu_thread_mutex_t *mutex)
- int starpu_pthread_mutex_trylock (starpu_thread_mutex_t *mutex)
• int starpu_pthread_mutexattr_gettype (const starpu_pthread_mutexattr_t *attr, int *type)
• int starpu_pthread_mutexattr_settype (starpu_pthread_mutexattr_t *attr, int type)
• int starpu_pthread_mutexattr_destroy (starpu_pthread_mutexattr_t *attr)
• int starpu_pthread_mutexattr_init (starpu_pthread_mutexattr_t *attr)
• int starpu_pthread_key_create (starpu_pthread_key_t *key, void(*)(void *))
• int starpu_pthread_key_delete (starpu_pthread_key_t key)
• int starpu_pthread_setspecific (starpu_pthread_key_t key, const void *pointer)
• void * starpu_pthread_getspecific (starpu_pthread_key_t key)
• int starpu_pthread_cond_init (starpu_pthread_cond_t *cond, starpu_pthread_condattr_t *cond_attr)
• int starpu_pthread_cond_signal (starpu_pthread_cond_t *cond)
• int starpu_pthread_cond_broadcast (starpu_pthread_cond_t *cond)
• int starpu_pthread_cond_wait (starpu_pthread_cond_t *cond, starpu_pthread_mutex_t *mutex)
• int starpu_pthread_cond_timedwait (starpu_pthread_cond_t *cond, starpu_pthread_mutex_t *mutex, const struct timespec *abstime)
• int starpu_pthread_cond_destroy (starpu_pthread_cond_t *cond)
• int starpu_pthread_rwlock_init (starpu_pthread_rwlock_t *rwlock, const starpu_pthread_rwlockattr_t *attr)
• int starpu_pthread_rwlock_destroy (starpu_pthread_rwlock_t *rwlock)

• void starpu_sleep (float nb_sec)

29.5.1 Detailed Description

This section describes the thread facilities provided by StarPU. The thread function are either implemented on top of the pthread library or the Simgrid library when the simulated performance mode is enabled (SimGrid Support).

29.5.2 Macro Definition Documentation

29.5.2.1 STARPU_PTHREAD_CREATE_ON

#define STARPU_PTHREAD_CREATE_ON(name, thread, attr, routine, arg, where )

Call starpu_pthread_create_on() and abort on error.
29.5 Threads

29.5.2.2 STARPU_PTHREAD_CREATE

#define STARPU_PTHREAD_CREATE(
    thread,
    attr,
    routine,
    arg )

Call starpu_pthread_create() and abort on error.

29.5.2.3 STARPU_PTHREAD_MUTEX_INIT

#define STARPU_PTHREAD_MUTEX_INIT(
    mutex,
    attr )

Call starpu_pthread_mutex_init() and abort on error.

29.5.2.4 STARPU_PTHREAD_MUTEX_DESTROY

#define STARPU_PTHREAD_MUTEX_DESTROY(
    mutex )

Call starpu_pthread_mutex_destroy() and abort on error.

29.5.2.5 STARPU_PTHREAD_MUTEX_LOCK

#define STARPU_PTHREAD_MUTEX_LOCK(
    mutex )

Call starpu_pthread_mutex_lock() and abort on error.

29.5.2.6 STARPU_PTHREAD_MUTEX_UNLOCK

#define STARPU_PTHREAD_MUTEX_UNLOCK(
    mutex )

Call starpu_pthread_mutex_unlock() and abort on error.

29.5.2.7 STARPU_PTHREAD_KEY_CREATE

#define STARPU_PTHREAD_KEY_CREATE(
    key,
    destr )

Call starpu_pthread_key_create() and abort on error.

29.5.2.8 STARPU_PTHREAD_KEY_DELETE

#define STARPU_PTHREAD_KEY_DELETE(
    key )

Call starpu_pthread_key_delete() and abort on error.

29.5.2.9 STARPU_PTHREAD_SETSPECIFIC

#define STARPU_PTHREAD_SETSPECIFIC(
    key,
    ptr )

Call starpu_pthread_setspecific() and abort on error.

29.5.2.10 STARPU_PTHREAD_GETSPECIFIC

#define STARPU_PTHREAD_GETSPECIFIC(
    key )

Call starpu_pthread_getspecific() and abort on error.
29.5.2.11 STARPU_PTHREAD_RWLOCK_INIT
#define STARPU_PTHREAD_RWLOCK_INIT(
    rwlock,
    attr
)
Call starpu_pthread_rwlock_init() and abort on error.

29.5.2.12 STARPU_PTHREAD_RWLOCK_RDLOCK
#define STARPU_PTHREAD_RWLOCK_RDLOCK(
    rwlock
)
Call starpu_pthread_rwlock_rdlock() and abort on error.

29.5.2.13 STARPU_PTHREAD_RWLOCK_WRLOCK
#define STARPU_PTHREAD_RWLOCK_WRLOCK(
    rwlock
)
Call starpu_pthread_rwlock_wrlock() and abort on error.

29.5.2.14 STARPU_PTHREAD_RWLOCK_UNLOCK
#define STARPU_PTHREAD_RWLOCK_UNLOCK(
    rwlock
)
Call starpu_pthread_rwlock_unlock() and abort on error.

29.5.2.15 STARPU_PTHREAD_RWLOCK_DESTROY
#define STARPU_PTHREAD_RWLOCK_DESTROY(
    rwlock
)
Call starpu_pthread_rwlock_destroy() and abort on error.

29.5.2.16 STARPU_PTHREAD_COND_INIT
#define STARPU_PTHREAD_COND_INIT(
    cond,
    attr
)
Call starpu_pthread_cond_init() and abort on error.

29.5.2.17 STARPU_PTHREAD_COND_DESTROY
#define STARPU_PTHREAD_COND_DESTROY(
    cond
)
Call starpu_pthread_cond_destroy() and abort on error.

29.5.2.18 STARPU_PTHREAD_COND_SIGNAL
#define STARPU_PTHREAD_COND_SIGNAL(
    cond
)
Call starpu_pthread_cond_signal() and abort on error.

29.5.2.19 STARPU_PTHREAD_COND_BROADCAST
#define STARPU_PTHREAD_COND_BROADCAST(
    cond
)
Call starpu_pthread_cond_broadcast() and abort on error.
29.5 Threads

29.5.2.20 STARPU_PTHREAD_COND_WAIT

#define STARPU_PTHREAD_COND_WAIT(
    cond,
    mutex 
)

Call starpu_pthread_cond_wait() and abort on error.

29.5.2.21 STARPU_PTHREAD_BARRIER_INIT

#define STARPU_PTHREAD_BARRIER_INIT(
    barrier,
    attr,
    count 
)

Call starpu_pthread_barrier_init() and abort on error.

29.5.2.22 STARPU_PTHREAD_BARRIER_DESTROY

#define STARPU_PTHREAD_BARRIER_DESTROY(
    barrier 
)

Call starpu_pthread_barrier_destroy() and abort on error.

29.5.2.23 STARPU_PTHREAD_BARRIER_WAIT

#define STARPU_PTHREAD_BARRIER_WAIT(
    barrier 
)

Call starpu_pthread_barrier_wait() and abort on error.

29.5.2.24 STARPU_PTHREAD_MUTEX_INITIALIZER

STARPU_PTHREAD_MUTEX_INITIALIZER

Initialize the mutex given in parameter.

29.5.2.25 STARPU_PTHREAD_COND_INITIALIZER

STARPU_PTHREAD_COND_INITIALIZER

Initialize the condition variable given in parameter.

29.5.3 Function Documentation

29.5.3.1 starpu_pthread_create()

int starpu_pthread_create ( 
    starpu_pthread_t * thread,
    const starpu_pthread_attr_t * attr,
    void *(*)(void *) start_routine,
    void * arg 
)

Start a new thread in the calling process. The new thread starts execution by invoking start_routine; arg is passed as the sole argument of start_routine.

29.5.3.2 starpu_pthread_join()

int starpu_pthread_join ( 
    starpu_pthread_t thread,
    void ** retval 
)

Wait for the thread specified by thread to terminate. If that thread has already terminated, then the function returns immediately. The thread specified by thread must be joinable.
29.5.3.3  starpu_pthread_exit()

int starpu_pthread_exit ( void * retval )

Terminate the calling thread and return a value via retval that (if the thread is joinable) is available to another thread in the same process that calls starpu_pthread_join().

29.5.3.4  starpu_pthread_attr_init()

int starpu_pthread_attr_init ( starpu_pthread_attr_t * attr )

Initialize the thread attributes object pointed to by attr with default attribute values. Do not do anything when the simulated performance mode is enabled (SimGrid Support).

29.5.3.5  starpu_pthread_attr_destroy()

int starpu_pthread_attr_destroy ( starpu_pthread_attr_t * attr )

Destroy a thread attributes object which is no longer required. Destroying a thread attributes object has no effect on threads that were created using that object. Do not do anything when the simulated performance mode is enabled (SimGrid Support).

29.5.3.6  starpu_pthread_attr_setdetachstate()

int starpu_pthread_attr_setdetachstate ( starpu_pthread_attr_t * attr, int detachstate )

Set the detach state attribute of the thread attributes object referred to by attr to the value specified in detachstate. The detach state attribute determines whether a thread created using the thread attributes object attr will be created in a joinable or a detached state. Do not do anything when the simulated performance mode is enabled (SimGrid Support).

29.5.3.7  starpu_pthread_mutex_init()

int starpu_pthread_mutex_init ( starpu_pthread_mutex_t * mutex, const starpu_pthread_mutexattr_t * mutexattr )

Initialize the mutex object pointed to by mutex according to the mutex attributes specified in mutexattr. If mutexattr is NULL, default attributes are used instead.

29.5.3.8  starpu_pthread_mutex_destroy()

int starpu_pthread_mutex_destroy ( starpu_pthread_mutex_t * mutex )

Destroy a mutex object, and free the resources it might hold. The mutex must be unlocked on entrance.

29.5.3.9  starpu_pthread_mutex_lock()

int starpu_pthread_mutex_lock ( starpu_pthread_mutex_t * mutex )

Lock the given mutex. If mutex is currently unlocked, it becomes locked and owned by the calling thread, and the function returns immediately. If mutex is already locked by another thread, the function suspends the calling thread until mutex is unlocked. This function also produces trace when the configure option --enable-fxt-lock is enabled.

29.5.3.10  starpu_pthread_mutex_unlock()

int starpu_pthread_mutex_unlock ( starpu_pthread_mutex_t * mutex )

Generated by Doxygen
Unlock the given mutex. The mutex is assumed to be locked and owned by the calling thread on entrance to `starpu_pthread_mutex_unlock()`. This function also produces trace when the configure option `--enable-fxt-lock` is enabled.

29.5.3.11 `starpu_pthread_mutex_trylock()`

```c
int starpu_pthread_mutex_trylock ( 
    starpu_pthread_mutex_t * mutex 
)
```

Behave identically to `starpu_pthread_mutex_lock()`, except that it does not block the calling thread if the mutex is already locked by another thread (or by the calling thread in the case of a “fast” mutex). Instead, the function returns immediately with the error code `EBUSY`. This function also produces trace when the configure option `--enable-fxt-lock` is enabled.

29.5.3.12 `starpu_pthread_mutexattr_gettype()`

```c
int starpu_pthread_mutexattr_gettype ( 
    const starpu_pthread_mutexattr_t * attr, 
    int * type 
)
todo
```

29.5.3.13 `starpu_pthread_mutexattr_settype()`

```c
int starpu_pthread_mutexattr_settype ( 
    starpu_pthread_mutexattr_t * attr, 
    int type 
)
todo
```

29.5.3.14 `starpu_pthread_mutexattr_destroy()`

```c
int starpu_pthread_mutexattr_destroy ( 
    starpu_pthread_mutexattr_t * attr 
)
todo
```

29.5.3.15 `starpu_pthread_mutexattr_init()`

```c
int starpu_pthread_mutexattr_init ( 
    starpu_pthread_mutexattr_t * attr 
)
todo
```

29.5.3.16 `starpu_pthread_key_create()`

```c
int starpu_pthread_key_create ( 
    starpu_pthread_key_t * key, 
    void(*)(void *) destr_function 
)
```

Allocate a new TSD key. The key is stored in the location pointed to by `key`.

29.5.3.17 `starpu_pthread_key_delete()`

```c
int starpu_pthread_key_delete ( 
    starpu_pthread_key_t key 
)
```

Deallocation a TSD key. Do not check whether non-NULL values are associated with that key in the currently executing threads, nor call the destructor function associated with the key.

29.5.3.18 `starpu_pthread_setspecific()`

```c
int starpu_pthread_setspecific ( 
    starpu_pthread_key_t key, 
    const void * pointer 
)
```

Change the value associated with `key` in the calling thread, storing the given `pointer` instead.
29.5.3.19 starpu_pthread_getspecific()

```c
void * starpu_pthread_getspecific (  
    starpu_pthread_key_t key  
);  
```

Return the value associated with `key` on success, and NULL on error.

29.5.3.20 starpu_pthread_cond_init()

```c
int starpu_pthread_cond_init (  
    starpu_pthread_cond_t * cond,  
    starpu_pthread_condattr_t * cond_attr  
);  
```

Initialize the condition variable `cond`, using the condition attributes specified in `cond_attr`, or default attributes if `cond_attr` is NULL.

29.5.3.21 starpu_pthread_cond_signal()

```c
int starpu_pthread_cond_signal (  
    starpu_pthread_cond_t * cond  
);  
```

Restart one of the threads that are waiting on the condition variable `cond`. If no threads are waiting on `cond`, nothing happens. If several threads are waiting on `cond`, exactly one is restarted, but it is not specified which.

29.5.3.22 starpu_pthread_cond_broadcast()

```c
int starpu_pthread_cond_broadcast (  
    starpu_pthread_cond_t * cond  
);  
```

Restart all the threads that are waiting on the condition variable `cond`. Nothing happens if no threads are waiting on `cond`.

29.5.3.23 starpu_pthread_cond_wait()

```c
int starpu_pthread_cond_wait (  
    starpu_pthread_cond_t * cond,  
    starpu_pthread_mutex_t * mutex  
);  
```

Atomically unlock `mutex` (as per `starpu_pthread_mutex_unlock()`) and wait for the condition variable `cond` to be signaled. The thread execution is suspended and does not consume any CPU time until the condition variable is signaled. The mutex must be locked by the calling thread on entrance to `starpu_pthread_cond_wait()`. Before returning to the calling thread, the function re-acquires `mutex` (as per `starpu_pthread_mutex_lock()`). This function also produces trace when the configure option `--enable-fxt-lock` is enabled.

29.5.3.24 starpu_pthread_cond_timedwait()

```c
int starpu_pthread_cond_timedwait (  
    starpu_pthread_cond_t * cond,  
    starpu_pthread_mutex_t * mutex,  
    const struct timespec * abstime  
);  
```

Atomically unlocks `mutex` and wait on `cond`, as `starpu_pthread_cond_wait()` does, but also bound the duration of the wait with `abstime`.

29.5.3.25 starpu_pthread_cond_destroy()

```c
int starpu_pthread_cond_destroy (  
    starpu_pthread_cond_t * cond  
);  
```

Destroy a condition variable, freeing the resources it might hold. No threads must be waiting on the condition variable on entrance to the function.

29.5.3.26 starpu_pthread_rwlock_init()

```c
int starpu_pthread_rwlock_init (  
    starpu_pthread_rwlock_t * rwlock,  
    const starpu_pthread_rwlockattr_t * attr  
);  
```
29.5 Threads

Similar to `starpu_pthread_mutex_init()`.

### 29.5.3.27 starpu_pthread_rwlock_destroy()

```c
int starpu_pthread_rwlock_destroy ( starpu_pthread_rwlock_t * rwlock )
```

Similar to `starpu_pthread_mutex_destroy()`.

### 29.5.3.28 starpu_pthread_rwlock_rdlock()

```c
int starpu_pthread_rwlock_rdlock ( starpu_pthread_rwlock_t * rwlock )
```

Similar to `starpu_pthread_mutex_lock()`.

### 29.5.3.29 starpu_pthread_rwlock_tryrdlock()

```c
int starpu_pthread_rwlock_tryrdlock ( starpu_pthread_rwlock_t * rwlock )
```

todo

### 29.5.3.30 starpu_pthread_rwlock_wrlock()

```c
int starpu_pthread_rwlock_wrlock ( starpu_pthread_rwlock_t * rwlock )
```

Similar to `starpu_pthread_mutex_lock()`.

### 29.5.3.31 starpu_pthread_rwlock_trywrlock()

```c
int starpu_pthread_rwlock_trywrlock ( starpu_pthread_rwlock_t * rwlock )
```

todo

### 29.5.3.32 starpu_pthread_rwlock_unlock()

```c
int starpu_pthread_rwlock_unlock ( starpu_pthread_rwlock_t * rwlock )
```

Similar to `starpu_pthread_mutex_unlock()`.

### 29.5.3.33 starpu_pthread_barrier_init()

```c
int starpu_pthread_barrier_init ( starpu_pthread_barrier_t * barrier,  
const starpu_pthread_barrierattr_t * attr,  
unsigned count )
```

todo

### 29.5.3.34 starpu_pthread_barrier_destroy()

```c
int starpu_pthread_barrier_destroy ( starpu_pthread_barrier_t * barrier )
```

todo

### 29.5.3.35 starpu_pthread_barrier_wait()

```c
int starpu_pthread_barrier_wait ( starpu_pthread_barrier_t * barrier )
```

todo
29.5.3.36  starpu_pthread_spin_init()

int starpu_pthread_spin_init (  
    starpu_pthread_spinlock_t * lock,  
    int pshared )
todo

29.5.3.37  starpu_pthread_spin_destroy()

int starpu_pthread_spin_destroy (  
    starpu_pthread_spinlock_t * lock )
todo

29.5.3.38  starpu_pthread_spin_lock()

int starpu_pthread_spin_lock (  
    starpu_pthread_spinlock_t * lock )
todo

29.5.3.39  starpu_pthread_spin_trylock()

int starpu_pthread_spin_trylock (  
    starpu_pthread_spinlock_t * lock )
todo

29.5.3.40  starpu_pthread_spin_unlock()

int starpu_pthread_spin_unlock (  
    starpu_pthread_spinlock_t * lock )
todo

29.5.3.41  starpu_sleep()

void starpu_sleep (  
    float nb_sec )
Similar to calling Unix' sleep function, except that it takes a float to allow sub-second sleeping, and when StarPU is compiled in simgrid mode it does not really sleep but just makes simgrid record that the thread has taken some time to sleep.

29.6  Bitmap

This section describes the bitmap facilities provided by StarPU.

Data Structures

- struct starpu_bitmap

Functions

- struct starpu_bitmap * starpu_bitmap_create (void) STARPU_ATTRIBUTE_MALLOC
- void starpu_bitmap_destroy (struct starpu_bitmap *b)
- void starpu_bitmap_set (struct starpu_bitmap *b, int e)
- void starpu_bitmap_unset (struct starpu_bitmap *b, int e)
- void starpu_bitmap_unset_all (struct starpu_bitmap *b)
- int starpu_bitmap_get (struct starpu_bitmap *b, int e)
- void starpu_bitmap_unset_and (struct starpu_bitmap *a, struct starpu_bitmap *b, struct starpu_bitmap *c)
- void starpu_bitmap_or (struct starpu_bitmap *a, struct starpu_bitmap *b)
- int starpu_bitmap_and_get (struct starpu_bitmap *b1, struct starpu_bitmap *b2, int e)
29.6 Bitmap

29.6.1 Detailed Description
This section describes the bitmap facilities provided by StarPU.

29.6.2 Data Structure Documentation
29.6.2.1 struct starpu_bitmap
todo

29.6.3 Function Documentation

29.6.3.1 starpu_bitmap_create()

```c
struct starpu_bitmap * starpu_bitmap_create (  
    void   )
```
create a empty `starpu_bitmap`

29.6.3.2 starpu_bitmap_destroy()

```c
void starpu_bitmap_destroy (  
    struct starpu_bitmap * b )
```
free

29.6.3.3 starpu_bitmap_set()

```c
void starpu_bitmap_set (  
    struct starpu_bitmap * b,  
    int    e )
```
set bit `e` in `b`

29.6.3.4 starpu_bitmap_unset()

```c
void starpu_bitmap_unset (  
    struct starpu_bitmap * b,  
    int    e )
```
unset bit `e` in `b`

29.6.3.5 starpu_bitmap_unset_all()

```c
void starpu_bitmap_unset_all (  
    struct starpu_bitmap * b )
```
unset all bits in `b`

29.6.3.6 starpu_bitmap_get()

```c
int starpu_bitmap_get (  
    struct starpu_bitmap * b,  
    int    e )
```
return true iff bit `e` is set in `b`
29.6.3.7  \texttt{starpu_bitmap_unset_and()}

void starpu_bitmap_unset_and (  
  struct starpu_bitmap * a,  
  struct starpu_bitmap * b,  
  struct starpu_bitmap * c )

Basically compute \texttt{starpu_bitmap_unset_all(a)}; \(a = b \& c\);

29.6.3.8  \texttt{starpu_bitmap_or()}

void starpu_bitmap_or (  
  struct starpu_bitmap * a,  
  struct starpu_bitmap * b )

Basically compute \(a = b\)

29.6.3.9  \texttt{starpu_bitmap_and_get()}

int starpu_bitmap_and_get (  
  struct starpu_bitmap * b1,  
  struct starpu_bitmap * b2,  
  int e )

return 1 iff \(e\) is set in \(b1\) AND \(e\) is set in \(b2\)

29.6.3.10  \texttt{starpu_bitmap_cardinal()}

int starpu_bitmap_cardinal (  
  struct starpu_bitmap * b )

return the number of set bits in \(b\)

29.6.3.11  \texttt{starpu_bitmap_first()}

int starpu_bitmap_first (  
  struct starpu_bitmap * b )

return the index of the first set bit of \(b\), -1 if none

29.6.3.12  \texttt{starpu_bitmap_last()}

int starpu_bitmap_last (  
  struct starpu_bitmap * b )

return the position of the last set bit of \(b\), -1 if none

29.6.3.13  \texttt{starpu_bitmap_next()}

int starpu_bitmap_next (  
  struct starpu_bitmap * b,  
  int e )

return the position of set bit right after \(e\) in \(b\), -1 if none

29.6.3.14  \texttt{starpu_bitmap_has_next()}

int starpu_bitmap_has_next (  
  struct starpu_bitmap * b,  
  int e )

todo

29.7.1 Detailed Description

29.7.2 Data Structure Documentation

29.7.2.1 struct starpu_worker_collection

A scheduling context manages a collection of workers that can be memorized using different data structures. Thus, a generic structure is available in order to simplify the choice of its type. Only the list data structure is available but further data structures (like tree) implementations are foreseen.

Data Fields

29.7.3  Macro Definition Documentation

29.7.3.1  STARPU_NMAXWORKERS

#define STARPU_NMAXWORKERS

Define the maximum number of workers managed by StarPU.

29.7.3.2  STARPU_MAXCPUS

#define STARPU_MAXCPUS

Define the maximum number of CPU workers managed by StarPU. The default value can be modified at configure by using the option --enable-maxcpus.

29.7.3.3  STARPU_MAXNUMANODES

#define STARPU_MAXNUMANODES

Define the maximum number of NUMA nodes managed by StarPU. The default value can be modified at configure by using the option --enable-maxnumanodes.

29.7.3.4  STARPU_MAXNODES

#define STARPU_MAXNODES

Define the maximum number of memory nodes managed by StarPU. The default value can be modified at configure by using the option --enable-maxnodes. Reducing it allows to considerably reduce memory used by StarPU data structures.

29.7.3.5  starpu_worker_get_id_check

unsigned starpu_worker_get_id_check()

Similar to starpu_worker_get_id(), but abort when called from outside a worker (i.e. when starpu_worker_get_id() would return -1).

29.7.4  Enumeration Type Documentation

29.7.4.1  starpu_node_kind

enum starpu_node_kind

TODO

Enumerator

</tr>
</tbody>
</table>
```

### 29.7.4.3 starpu_worker_collection_type

```c
enum starpu_worker_collection_type
Types of structures the worker collection can implement

<table>
<thead>
<tr>
<th>STARPU_WORKER_TREE</th>
<th>The collection is a tree</th>
</tr>
</thead>
<tbody>
<tr>
<td>STARPU_WORKER_LIST</td>
<td>The collection is an array</td>
</tr>
</tbody>
</table>
```

### 29.7.5 Function Documentation

#### 29.7.5.1 starpu_worker_get_count()

```c
unsigned starpu_worker_get_count ( 
    void )
```

Return the number of workers (i.e. processing units executing StarPU tasks). The returned value should be at most **STARPU_NMAXWORKERS**.

#### 29.7.5.2 starpu_worker_get_count_by_type()

```c
int starpu_worker_get_count_by_type ( 
```

---

Generated by Doxygen
enum starpu_worker_archtype type

Return the number of workers of type. A positive (or NULL) value is returned in case of success, -EINVAL indicates that type is not valid otherwise.

29.7.5.3 starpu_cpu_worker_get_count()

unsigned starpu_cpu_worker_get_count ( void )

Return the number of CPUs controlled by StarPU. The returned value should be at most STARPU_MAXCPUS.

29.7.5.4 starpu_cuda_worker_get_count()

unsigned starpu_cuda_worker_get_count ( void )

Return the number of CUDA devices controlled by StarPU. The returned value should be at most STARPU_MAXCUDADEV.

29.7.5.5 starpu_mic_worker_get_count()

unsigned starpu_mic_worker_get_count ( void )

Return the number of MIC workers controlled by StarPU.

29.7.5.6 starpu_mic_device_get_count()

unsigned starpu_mic_device_get_count ( void )

Return the number of MIC devices controlled by StarPU. The returned value should be at most STARPU_MAXMICDEV.

29.7.5.7 starpu_mpi_ms_worker_get_count()

unsigned starpu_mpi_ms_worker_get_count ( void )

Return the number of MPI Master Slave workers controlled by StarPU.

29.7.5.8 starpu_scc_worker_get_count()

unsigned starpu_scc_worker_get_count ( void )

Return the number of SCC devices controlled by StarPU. The returned value should be at most STARPU_MAXCCDEV.

29.7.5.9 starpu_opencl_worker_get_count()

unsigned starpu_opencl_worker_get_count ( void )

Return the number of OpenCL devices controlled by StarPU. The returned value should be at most STARPU_MAXAXOPENCLDEV.

29.7.5.10 starpu_worker_get_id()

int starpu_worker_get_id ( void )

Return the identifier of the current worker, i.e the one associated to the calling thread. The returned value is either -1 if the current context is not a StarPU worker (i.e. when called from the application outside a task or a callback), or an integer between 0 and starpu_worker_get_count() - 1.
29.7.5.11 starpu_worker_get_ids_by_type()

```
unsigned starpu_worker_get_ids_by_type (  
    enum starpu_worker_archtype type,       
    int * workerids,                       
    unsigned maxsize )                     
```

Get the list of identifiers of workers of type. Fill the array workerids with the identifiers of the workers. The argument maxsize indicates the size of the array workerids. The returned value gives the number of identifiers that were put in the array. -ERANGE is returned if maxsize is lower than the number of workers with the appropriate type: in that case, the array is filled with the maxsize first elements. To avoid such overflows, the value of maxsize can be chosen by the means of the function starpu_worker_get_count_by_type(), or by passing a value greater or equal to STARPU_NMAXWORKERS.

29.7.5.12 starpu_worker_get_by_type()

```
int starpu_worker_get_by_type (  
    enum starpu_worker_archtype type,       
    int num )                               
```

Return the identifier of the num-th worker that has the specified type. If there is no such worker, -1 is returned.

29.7.5.13 starpu_worker_get_by_devid()

```
int starpu_worker_get_by_devid (  
    enum starpu_worker_archtype type,       
    int devid )                            
```

Return the identifier of the worker that has the specified type and device id devid (which may not be the n-th, if some devices are skipped for instance). If there is no such worker, -1 is returned.

29.7.5.14 starpu_worker_get_devid()

```
int starpu_worker_get_devid (  
    int id )                               
```

Return the device id of the worker id. The worker should be identified with the value returned by the starpu←worker_get_id() function. In the case of a CUDA worker, this device identifier is the logical device identifier exposed by CUDA (used by the function cudaGetDevice() for instance). The device identifier of a CPU worker is the logical identifier of the core on which the worker was bound; this identifier is either provided by the OS or by the library hwloc in case it is available.

29.7.5.15 starpu_worker_get_type()

```
enum starpu_worker_archtype starpu_worker_get_type (  
    int id )                               
```

Return the type of processing unit associated to the worker id. The worker identifier is a value returned by the function starpu←worker_get_id(). The returned value indicates the architecture of the worker: STARPU_CPU_WORKER for a CPU core, STARPU_CUDA_WORKER for a CUDA device, and STARPU_OPENCL_WORKER for a OpenCL device. The value returned for an invalid identifier is unspecified.

29.7.5.16 starpu_worker_get_name()

```
void starpu_worker_get_name (  
    int id,                               
    char * dst,                           
    size_t maxlen )                       
```

Allow to get the name of the worker id. StarPU associates a unique human readable string to each processing unit. This function copies at most the maxlen first bytes of the unique string associated to the worker id into the dst buffer. The caller is responsible for ensuring that dst is a valid pointer to a buffer of maxlen bytes at least. Calling this function on an invalid identifier results in an unspecified behaviour.
29.7.5.17 starpu_worker_display_names()

```c
void starpu_worker_display_names (  
    FILE ∗ output,  
    enum starpu_worker_archtype type )
```

Display on `output` the list (if any) of all the workers of the given `type`.

29.7.5.18 starpu_worker_get_memory_node()

```c
unsigned starpu_worker_get_memory_node (  
    unsigned workerid )
```

Return the identifier of the memory node associated to the worker identified by `workerid`.

29.7.5.19 starpu_node_get_kind()

```c
enum starpu_node_kind starpu_node_get_kind (  
    unsigned node )
```

Return the type of `node` as defined by `starpu_node_kind`. For example, when defining a new data interface, this function should be used in the allocation function to determine on which device the memory needs to be allocated.

29.7.5.20 starpu_memory_nodes_numa_id_to_devid()

```c
int starpu_memory_nodes_numa_id_to_devid (  
    int osid )
```

Return the identifier of the memory node associated to the NUMA node identified by `osid` by the Operating System.

29.7.5.21 starpu_memory_nodes_numa_devid_to_id()

```c
int starpu_memory_nodes_numa_devid_to_id (  
    unsigned id )
```

Return the Operating System identifier of the memory node whose StarPU identifier is `id`.

29.7.5.22 starpu_worker_get_type_as_string()

```c
char ∗ starpu_worker_get_type_as_string (  
    enum starpu_worker_archtype type )
```

Return worker `type` as a string.

29.7.5.23 starpu_worker_sched_op_pending()

```c
int starpu_worker_sched_op_pending (  
    void )
```

Return `!0` if current worker has a scheduling operation in progress, and `0` otherwise.

29.7.5.24 starpu_worker_relax_on()

```c
void starpu_worker_relax_on (  
    void )
```

Allow other threads and workers to temporarily observe the current worker state, even though it is performing a scheduling operation. Must be called by a worker before performing a potentially blocking call such as acquiring a mutex other than its own sched_mutex. This function increases `state_relax_refcnt` from the current worker. No more than `UINT_MAX-1` nested `relax_on` calls should performed on the same worker. This function is automatically called by `starpu_worker_lock` to relax the caller worker state while attempting to lock the target worker.
29.7.5.25 starpu_worker_relax_off()

```c
void starpu_worker_relax_off (
    void )
```

Must be called after a potentially blocking call is complete, to restore the relax state in place before the corresponding relax_on. Decreases state_relax_refcnt. Calls to starpu_worker_relax_on and starpu_worker←relax_off must be well parenthesized. This function is automatically called by starpu_worker_unlock after the target worker has been unlocked.

29.7.5.26 starpu_worker_get_relax_state()

```c
int starpu_worker_get_relax_state (
    void )
```

Returns !0 if the current worker state_relax_refcnt!=0 and 0 otherwise.

29.7.5.27 starpu_worker_lock()

```c
void starpu_worker_lock (
    int workerid )
```

Acquire the sched mutex of workerid. If the caller is a worker, distinct from workerid, the caller worker automatically enter relax state while acquiring the target worker lock.

29.7.5.28 starpu_worker_trylock()

```c
int starpu_worker_trylock (
    int workerid )
```

Attempt to acquire the sched mutex of workerid. Returns 0 if successful, !0 if workerid sched mutex is held or the corresponding worker is not in relaxed stated. If the caller is a worker, distinct from workerid, the caller worker automatically enter relax state if successfully acquiring the target worker lock.

29.7.5.29 starpu_worker_unlock()

```c
void starpu_worker_unlock (
    int workerid )
```

Release the previously acquired sched mutex of workerid. Restore the relaxed state of the caller worker if needed.

29.7.5.30 starpu_worker_lock_self()

```c
void starpu_worker_lock_self ( 
    void )
```

Acquire the current worker sched mutex.

29.7.5.31 starpu_worker_unlock_self()

```c
void starpu_worker_unlock_self ( 
    void )
```

Release the current worker sched mutex.

29.7.5.32 starpu_wake_worker_relax()

```c
int starpu_wake_worker_relax ( 
    int workerid )
```

Wake up workerid while temporarily entering the current worker relaxed state if needed during the waiting process. Returns 1 if workerid has been woken up or its state_keep_awake flag has been set to 1, and 0 otherwise (if workerid was not in the STATE_SLEEPING or in the STATE_SCHEDULING).
29.7.33  starpu_wake_worker_relax_light()

int starpu_wake_worker_relax_light (int workerid)

This is a light version of starpu_wake_worker_relax() which, when possible, speculatively sets keep_awake on the
target worker without waiting that worker to enter the relaxed state.

29.7.34  starpu_worker_get_hwloc_cpuset()

hwloc_cpuset_t starpu_worker_get_hwloc_cpuset (int workerid)

If StarPU was compiled with hwloc support, returns a duplicate of the hwloc cpuset associated with the worker
workerid. The returned cpuset is obtained from a hwloc_bitmap_dup() function call. It must be freed by
the caller using hwloc_bitmap_free().

29.8 Data Management

This section describes the data management facilities provided by StarPU. We show how to use existing data
interfaces in Data Interfaces, but developers can design their own data interfaces if required.

Typedefs

- typedef struct _starpu_data_state * starpu_data_handle_t
- typedef struct starpu_arbiter * starpu_arbiter_t

Enumerations

- enum starpu_data_access_mode {STARPU_NONE, STARPU_R, STARPU_W, STARPU_RW,
STARPU_SCRATCH, STARPU_REDUX, STARPU_COMMUTE, STARPU_SSEND,
STARPU_LOCALITY, STARPU_ACCESS_MODE_MAX}

Basic Data Management API

Data management is done at a high-level in StarPU: rather than accessing a mere list of contiguous buffers, the
tasks may manipulate data that are described by a high-level construct which we call data interface.

An example of data interface is the "vector" interface which describes a contiguous data array on a specific memory
node. This interface is a simple structure containing the number of elements in the array, the size of the elements,
and the address of the array in the appropriate address space (this address may be invalid if there is no valid copy
of the array in the memory node). More informations on the data interfaces provided by StarPU are given in Data
Interfaces.

When a piece of data managed by StarPU is used by a task, the task implementation is given a pointer to an
interface describing a valid copy of the data that is accessible from the current processing unit.

Every worker is associated to a memory node which is a logical abstraction of the address space from which the
processing unit gets its data. For instance, the memory node associated to the different CPU workers represents
main memory (RAM), the memory node associated to a GPU is DRAM embedded on the device. Every memory
node is identified by a logical index which is accessible from the function starpu_worker_get_memory_node(). When
registering a piece of data to StarPU, the specified memory node indicates where the piece of data initially resides
(we also call this memory node the home node of a piece of data).

In the case of NUMA systems, functions starpu_memory_nodes_numa_devid_to_id() and starpu_memory_nodes←
numa_id_to_devid() can be used to convert from NUMA node numbers as seen by the Operating System and
NUMA node numbers as seen by StarPU.

- void starpu_data_register (starpu_data_handle_t *handleptr, int home_node, void *data_interface, struct
starpu_data_interface_ops *ops)
- void starpu_data_ptr_register (starpu_data_handle_t handle, unsigned node)
- void starpu_data_register_same (starpu_data_handle_t *handledst, starpu_data_handle_t handlesrc)

- `void starpu_arbiter_destroy (starpu_arbiter_t arbiter)`

29.8.1 Detailed Description

This section describes the data management facilities provided by StarPU. We show how to use existing data interfaces in Data Interfaces, but developers can design their own data interfaces if required.

29.8.2 Macro Definition Documentation
29.8.2.1 STARPU_ACQUIRE_NO_NODE

#define STARPU_ACQUIRE_NO_NODE
This macro can be used to acquire data, but not require it to be available on a given node, only enforce R/W dependencies. This can for instance be used to wait for tasks which produce the data, but without requesting a fetch to the main memory.

29.8.2.2 STARPU_ACQUIRE_NO_NODE_LOCK_ALL

#define STARPU_ACQUIRE_NO_NODE_LOCK_ALL
This is the same as STARPU_ACQUIRE_NO_NODE, but will lock the data on all nodes, preventing them from being evicted for instance. This is mostly useful inside starpu only.

29.8.2.3 STARPU_DATA_ACQUIRE_CB

#define STARPU_DATA_ACQUIRE_CB(
   handle,
   mode,
   code
)
STARPU_DATA_ACQUIRE_CB() is the same as starpu_data_acquire_cb(), except that the code to be executed in a callback is directly provided as a macro parameter, and the data handle is automatically released after it. This permits to easily execute code which depends on the value of some registered data. This is non-blocking too and may be called from task callbacks.

29.8.3 Typedef Documentation

29.8.3.1 starpu_data_handle_t

starpu_data_handle_t
StarPU uses starpu_data_handle_t as an opaque handle to manage a piece of data. Once a piece of data has been registered to StarPU, it is associated to a starpu_data_handle_t which keeps track of the state of the piece of data over the entire machine, so that we can maintain data consistency and locate data replicates for instance.

29.8.3.2 starpu_arbiter_t

starpu_arbiter_t
This is an arbiter, which implements an advanced but centralized management of concurrent data accesses, see Concurrent Data Accesses for the details.

29.8.4 Enumeration Type Documentation

29.8.4.1 starpu_data_access_mode

enum starpu_data_access_mode
This datatype describes a data access mode.

### 29.8 Data Management

#### 29.8.5 Function Documentation

##### 29.8.5.1 starpu_data_register()

```c
void starpu_data_register (  
    starpu_data_handle_t * handleptr,  
    int home_node,  
    void * data_interface,  
    struct starpu_data_interface_ops * ops )
```

Register a piece of data into the handle located at the `handleptr` address. The `data_interface` buffer contains the initial description of the data in the `home_node`. The `ops` argument is a pointer to a structure describing the different methods used to manipulate this type of interface. See `starpu_data_interface_ops` for more details on this structure. If `home_node` is -1, StarPU will automatically allocate the memory when it is used for the first time in write-only mode. Once such data handle has been automatically allocated, it is possible to access it using any access mode. Note that StarPU supplies a set of predefined types of interface (e.g. vector or matrix) which can be registered by the means of helper functions (e.g. `starpu_vector_data_register()` or `starpu_matrix_data_register()`).

##### 29.8.5.2 starpu_data_ptr_register()

```c
void starpu_data_ptr_register (  
    starpu_data_handle_t handle,  
    unsigned node )
```

Register that a buffer for `handle` on `node` will be set. This is typically used by `starpu_*_ptr_register` helpers before setting the interface pointers for this node, to tell the core that that is now allocated.
29.8.5.3 starpu_data_register_same()

```c
void starpu_data_register_same ( 
    starpu_data_handle_t * handledst,
    starpu_data_handle_t handlesrc )
```

Register a new piece of data into the handle `handledst` with the same interface as the handle `handlesrc`.

29.8.5.4 starpu_data_unregister()

```c
void starpu_data_unregister ( 
    starpu_data_handle_t handle )
```

Unregister a data handle from StarPU. If the data was automatically allocated by StarPU because the home node was -1, all automatically allocated buffers are freed. Otherwise, a valid copy of the data is put back into the home node in the buffer that was initially registered. Using a data handle that has been unregistered from StarPU results in an undefined behaviour. In case we do not need to update the value of the data in the home node, we can use the function `starpu_data_unregister_no_coherency()` instead.

29.8.5.5 starpu_data_unregister_no_coherency()

```c
void starpu_data_unregister_no_coherency ( 
    starpu_data_handle_t handle )
```

This is the same as `starpu_data_unregister()`, except that StarPU does not put back a valid copy into the home node, in the buffer that was initially registered.

29.8.5.6 starpu_data_unregister_submit()

```c
void starpu_data_unregister_submit ( 
    starpu_data_handle_t handle )
```

Destroy the data handle once it is no longer needed by any submitted task. No coherency is assumed.

29.8.5.7 starpu_datainvalidate()

```c
void starpu_data_invalidate ( 
    starpu_data_handle_t handle )
```

Destroy all replicates of the data handle immediately. After data invalidation, the first access to `handle` must be performed in STARPU_W mode. Accessing an invalidated data in STARPU_R mode results in undefined behaviour.

29.8.5.8 starpu_datainvalidate_submit()

```c
void starpu_data_invalidate_submit ( 
    starpu_data_handle_t handle )
```

Submit invalidation of the data handle after completion of previously submitted tasks.

29.8.5.9 starpu_data_set_wt_mask()

```c
void starpu_data_set_wt_mask ( 
    starpu_data_handle_t handle,
    uint32_t wt_mask )
```

Set the write-through mask of the data handle (and its children), i.e. a bitmask of nodes where the data should be always replicated after modification. It also prevents the data from being evicted from these nodes when memory gets scare. When the data is modified, it is automatically transferred into these memory nodes. For instance a 1<<0 write-through mask means that the CUDA workers will commit their changes in main memory (node 0).

29.8.5.10 starpu_data_set_name()

```c
void starpu_data_set_name ( 
    starpu_data_handle_t handle,
    const char * name )
```

Set the name of the data, to be shown in various profiling tools.
29.8.5.11 starpu_data_set_coordinates_array()

```c
void starpu_data_set_coordinates_array (  
    starpu_data_handle_t handle,  
    int dimensions,  
    int dims[] )
```

Set the coordinates of the data, to be shown in various profiling tools. `dimensions` is the size of the `dims` array. This can be for instance the tile coordinates within a big matrix.

29.8.5.12 starpu_data_set_coordinates()

```c
void starpu_data_set_coordinates (  
    starpu_data_handle_t handle,  
    unsigned dimensions,  
    ... )
```

Set the coordinates of the data, to be shown in various profiling tools. `dimensions` is the number of subsequent `int` parameters. This can be for instance the tile coordinates within a big matrix.

29.8.5.13 starpu_data_fetch_on_node()

```c
int starpu_data_fetch_on_node (  
    starpu_data_handle_t handle,  
    unsigned node,  
    unsigned async )
```

Issue a fetch request for the data `handle` to `node`, i.e. requests that the data be replicated to the given node as soon as possible, so that it is available there for tasks. If `async` is 0, the call will block until the transfer is achieved, else the call will return immediately, after having just queued the request. In the latter case, the request will asynchronously wait for the completion of any task writing on the data.

29.8.5.14 starpu_data_prefetch_on_node()

```c
int starpu_data_prefetch_on_node (  
    starpu_data_handle_t handle,  
    unsigned node,  
    unsigned async )
```

Issue a prefetch request for the data `handle` to `node`, i.e. requests that the data be replicated to `node` when there is room for it, so that it is available there for tasks. If `async` is 0, the call will block until the transfer is achieved, else the call will return immediately, after having just queued the request. In the latter case, the request will asynchronously wait for the completion of any task writing on the data.

29.8.5.15 starpu_data_idle_prefetch_on_node()

```c
int starpu_data_idle_prefetch_on_node (  
    starpu_data_handle_t handle,  
    unsigned node,  
    unsigned async )
```

Issue an idle prefetch request for the data `handle` to `node`, i.e. requests that the data be replicated to `node`, so that it is available there for tasks, but only when the bus is really idle. If `async` is 0, the call will block until the transfer is achieved, else the call will return immediately, after having just queued the request. In the latter case, the request will asynchronously wait for the completion of any task writing on the data.

29.8.5.16 starpu_data_wont_use()

```c
void starpu_data_wont_use (  
    starpu_data_handle_t handle )
```

Advise StarPU that `handle` will not be used in the close future, and is thus a good candidate for eviction from GPUs. StarPU will thus write its value back to its home node when the bus is idle, and select this data in priority for eviction when memory gets low.

Generated by Doxygen
29.8.5.17 starpu_data_lookup()

```c
starpu_data_handle_t starpu_data_lookup (
    const void ∗ ptr
) 
```

Return the handle corresponding to the data pointed to by the `ptr` host pointer.

29.8.5.18 starpu_data_request_allocation()

```c
int starpu_data_request_allocation ( 
    starpu_data_handle_t handle,
    unsigned node
) 
```

Explicitly ask StarPU to allocate room for a piece of data on the specified `node`.

29.8.5.19 starpu_data_query_status()

```c
void starpu_data_query_status ( 
    starpu_data_handle_t handle,
    int memory_node,
    int ∗ is_allocated,
    int ∗ is_valid,
    int ∗ is_requested
) 
```

Query the status of `handle` on the specified `memory_node`.

29.8.5.20 starpu_data_advise_as_important()

```c
void starpu_data_advise_as_important ( 
    starpu_data_handle_t handle,
    unsigned is_important
) 
```

Specify that the data `handle` can be discarded without impacting the application.

29.8.5.21 starpu_data_set_reduction_methods()

```c
void starpu_data_set_reduction_methods ( 
    starpu_data_handle_t handle,
    struct starpu_codelet ∗ redux_cl,
    struct starpu_codelet ∗ init_cl
) 
```

Set the codelets to be used for `handle` when it is accessed in the mode `STARPU_REDUX`. Per-worker buffers will be initialized with the codelet `init_cl`, and reduction between per-worker buffers will be done with the codelet `redux_cl`.

29.8.5.22 starpu_data_get_interface_ops()

```c
struct starpu_data_interface_ops ∗ starpu_data_get_interface_ops ( 
    starpu_data_handle_t handle
) 
```

This retrieves the field `user_data` previously set for the handle.

29.8.5.23 starpu_data_set_user_data()

```c
void starpu_data_set_user_data ( 
    starpu_data_handle_t handle,
    void ∗ user_data
) 
```

Set the field `user_data` for the handle to `user_data`. It can then be retrieved with `starpu_data_get_user_data()`. `user_data` can be any application-defined value, for instance a pointer to an object-oriented container for the data.

29.8.5.24 starpu_data_get_user_data()

```c
void ∗ starpu_data_get_user_data ( 
    starpu_data_handle_t handle
) 
```

This retrieves the field `user_data` previously set for the handle.
29.8.5.25 starpu_data_acquire()

```c
int starpu_data_acquire(
    starpu_data_handle_t handle,
    enum starpu_data_access_mode mode)
```

The application must call this function prior to accessing registered data from main memory outside tasks. StarPU ensures that the application will get an up-to-date copy of `handle` in main memory located where the data was originally registered, and that all concurrent accesses (e.g. from tasks) will be consistent with the access mode specified with `mode`. `starpu_data_release()` must be called once the application no longer needs to access the piece of data. Note that implicit data dependencies are also enforced by `starpu_data_acquire()`, i.e. `starpu_data_acquire()` will wait for all tasks scheduled to work on the data, unless they have been disabled explicitly by calling `starpu_data_set_default_sequential_consistency_flag()` or `starpu_data_set_sequential_consistency_flag()`. `starpu_data_acquire()` is a blocking call, so that it cannot be called from tasks or from their callbacks (in that case, `starpu_data_acquire()` returns -EDEADLK). Upon successful completion, this function returns 0.

29.8.5.26 starpu_data_acquire_cb()

```c
int starpu_data_acquire_cb(
    starpu_data_handle_t handle,
    enum starpu_data_access_mode mode,
    void(*)(void *) callback,
    void * arg)
```

Asynchronous equivalent of `starpu_data_acquire()`. When the data specified in `handle` is available in the access mode, the `callback` function is executed. The application may access the requested data during the execution of `callback`. The `callback` function must call `starpu_data_release()` once the application no longer needs to access the piece of data. Note that implicit data dependencies are also enforced by `starpu_data_acquire_cb()` in case they are not disabled. Contrary to `starpu_data_acquire()`, this function is non-blocking and may be called from task callbacks. Upon successful completion, this function returns 0.

29.8.5.27 starpu_data_acquire_cb_sequential_consistency()

```c
int starpu_data_acquire_cb_sequential_consistency(
    starpu_data_handle_t handle,
    enum starpu_data_access_mode mode,
    void(*)(void *) callback,
    void * arg,
    int sequential_consistency)
```

Equivalent of `starpu_data_acquire_cb()` with the possibility of enabling or disabling data dependencies. When the data specified in `handle` is available in the access mode, the `callback` function is executed. The application may access the requested data during the execution of this `callback`. The `callback` function must call `starpu_data_release()` once the application no longer needs to access the piece of data. Note that implicit data dependencies are also enforced by `starpu_data_acquire_cb_sequential_consistency()` in case they are not disabled specifically for the given `handle` or by the parameter `sequential_consistency`. Similarly to `starpu_data_acquire_cb()`, this function is non-blocking and may be called from task callbacks. Upon successful completion, this function returns 0.

29.8.5.28 starpu_data_acquire_try()

```c
int starpu_data_acquire_try(
    starpu_data_handle_t handle,
    enum starpu_data_access_mode mode)
```

The application can call this function instead of `starpu_data_acquire()` so as to acquire the data like `starpu_data_acquire()`, but only if all previously-submitted tasks have completed, in which case `starpu_data_acquire_try()` returns 0. StarPU will have ensured that the application will get an up-to-date copy of `handle` in main memory located where the data was originally registered. `starpu_data_release()` must be called once the application no longer needs to access the piece of data. If not all previously-submitted tasks have completed, `starpu_data_acquire_try()` returns -EAGAIN, and `starpu_data_release()` must not be called.
29.8.5.29 starpu_data_acquire_on_node()

```c
int starpu_data_acquire_on_node (  
    starpu_data_handle_t handle,  
    int node,  
    enum starpu_data_access_mode mode )
```

This is the same as `starpu_data_acquire()`, except that the data will be available on the given memory node instead of main memory. `STARPU_ACQUIRE_NO_NODE` and `STARPU_ACQUIRE_NO_NODE_LOCK_ALL` can be used instead of an explicit node number.

29.8.5.30 starpu_data_acquire_on_node_cb()

```c
int starpu_data_acquire_on_node_cb (  
    starpu_data_handle_t handle,  
    int node,  
    enum starpu_data_access_mode mode,  
    void(*)(void *) callback,  
    void * arg )
```

This is the same as `starpu_data_acquire_cb()`, except that the data will be available on the given memory node instead of main memory. `STARPU_ACQUIRE_NO_NODE` and `STARPU_ACQUIRE_NO_NODE_LOCK_ALL` can be used instead of an explicit node number.

29.8.5.31 starpu_data_acquire_on_node_cb_sequential_consistency()

```c
int starpu_data_acquire_on_node_cb_sequential_consistency (   
    starpu_data_handle_t handle,  
    int node,  
    enum starpu_data_access_mode mode,  
    void(*)(void *) callback,  
    void * arg,  
    int sequential_consistency )
```

This is the same as `starpu_data_acquire_cb_sequential_consistency()`, except that the data will be available on the given memory node instead of main memory. `STARPU_ACQUIRE_NO_NODE` and `STARPU_ACQUIRE_NO_NODE_LOCK_ALL` can be used instead of an explicit node number.

29.8.5.32 starpu_data_acquire_on_node_try()

```c
int starpu_data_acquire_on_node_try (  
    starpu_data_handle_t handle,  
    int node,  
    enum starpu_data_access_mode mode )
```

This is the same as `starpu_data_acquire_try()`, except that the data will be available on the given memory node instead of main memory. `STARPU_ACQUIRE_NO_NODE` and `STARPU_ACQUIRE_NO_NODE_LOCK_ALL` can be used instead of an explicit node number.

29.8.5.33 starpu_data_release()

```c
void starpu_data_release (  
    starpu_data_handle_t handle )
```

Release the piece of data acquired by the application either by `starpu_data_acquire()` or by `starpu_data_acquire_cb()`.

29.8.5.34 starpu_data_release_on_node()

```c
void starpu_data_release_on_node (  
    starpu_data_handle_t handle,  
    int node )
```

This is the same as `starpu_data_release()`, except that the data will be available on the given memory node instead of main memory. The `node` parameter must be exactly the same as the corresponding `starpu_data_acquire_on_node` call.
29.8.5.35 starpu_arbiter_create()

starpu_arbiter_t starpu_arbiter_create (void)

Create a data access arbiter, see Concurrent Data Accesses for the details.

29.8.5.36 starpu_data_assign_arbiter()

void starpu_data_assign_arbiter (starpu_data_handle_t handle, starpu_arbiter_t arbiter)

Make access to handle managed by arbiter.

29.8.5.37 starpu_arbiter_destroy()

void starpu_arbiter_destroy (starpu_arbiter_t arbiter)

Destroy the arbiter. This must only be called after all data assigned to it have been unregistered.

29.9 Data Interfaces

Data Structures

- struct starpu_data_interface_ops
- struct starpu_data_copy_methods
- struct starpu_variable_interface
- struct starpu_vector_interface
- struct starpu_matrix_interface
- struct starpu_block_interface
- struct starpu_bcsr_interface
- struct starpu_csr_interface
- struct starpu_coo_interface

Enumerations

- enum starpu_data_interface_id {
  STARPU_UNKNOWN_INTERFACE_ID, STARPU_MATRIX_INTERFACE_ID, STARPU_BLOCK_INTERFACE_ID, STARPU_VECTOR_INTERFACE_ID,
  STARPU_CSR_INTERFACE_ID, STARPU_BCSR_INTERFACE_ID, STARPU_VARIABLE_INTERFACE_ID, STARPU_VOID_INTERFACE_ID,
  STARPU_MULTIFORMAT_INTERFACE_ID, STARPU_COO_INTERFACE_ID, STARPU_MAX_INTERFACE_ID
}

Registering Data

There are several ways to register a memory region so that it can be managed by StarPU. The functions below allow the registration of vectors, 2D matrices, 3D matrices as well as BCSR and CSR sparse matrices.

- void starpu_void_data_register (starpu_data_handle_t *handle)
- void starpu_variable_data_register (starpu_data_handle_t *handle, int home_node, uintptr_t ptr, size_t size)
- void starpu_variable_ptr_register (starpu_data_handle_t handle, unsigned node, uintptr_t ptr, uintptr_t dev_handle, size_t offset)
- void starpu_vector_data_register (starpu_data_handle_t *handle, int home_node, uintptr_t ptr, uint32_t nx, size_t elemsize)
- void starpu_vector_ptr_register (starpu_data_handle_t handle, unsigned node, uintptr_t ptr, uintptr_t dev_handle, size_t offset)
- void starpu_matrix_data_register (starpu_data_handle_t *handle, int home_node, uintptr_t ptr, uint32_t ld, uint32_t nx, uint32_t ny, size_t elemsize)
• void starpu_matrix_ptr_register (starpu_data_handle_t handle, unsigned node, uintptr_t ptr, uintptr_t dev_,
  handle, size_t offset, uint32_t ld)
• void starpu_block_data_register (starpu_data_handle_t *handle, int home_node, uintptr_t ptr, uint32_t ldy,
  uint32_t ldz, uint32_t nx, uint32_t ny, size_t elements)
• void starpu_block_ptr_register (starpu_data_handle_t handle, unsigned node, uintptr_t ptr, uintptr_t dev_,
  handle, size_t offset, uint32_t ldy, uint32_t ldz)
• void starpu_bcsr_data_register (starpu_data_handle_t *handle, int home_node, uint32_t nnz, uint32_t nrow,
  uintptr_t nzval, uint32_t *colind, uint32_t *rowptr, uint32_t firstentry, uint32_t r, uint32_t c, size_t elements)
• void starpu_csr_data_register (starpu_data_handle_t *handle, int home_node, uint32_t nnz, uint32_t nrow,
  uintptr_t nzval, uint32_t *colind, uint32_t *rowptr, uint32_t firstentry, size_t elements)
• void starpu_coo_data_register (starpu_data_handle_t *handleptr, int home_node, uint32_t nx, uint32_t ny,
  uint32_t n_values, uint32_t *columns, uint32_t *rows, uintptr_t values, size_t elements)
• void * starpu_data_get_interface_on_node (starpu_data_handle_t handle, unsigned memory_node)

Accessing Data Interfaces

Each data interface is provided with a set of field access functions. The ones using a void * parameter aimed to
be used in codelet implementations (see for example the code in Vector Scaling Using StarPU’s API).

• void * starpu_data_handle_to_pointer (starpu_data_handle_t handle, unsigned node)
• int starpu_data_pointer_is_inside (starpu_data_handle_t handle, unsigned node, void *ptr)
• void * starpu_data_get_local_ptr (starpu_data_handle_t handle)
• enum starpu_data_interface_id starpu_data_get_interface_id (starpu_data_handle_t handle)
• size_t starpu_data_get_size (starpu_data_handle_t handle)
• int starpu_data_pack (starpu_data_handle_t handle, void **ptr, starpu_ssize_t *count)
• int starpu_data_unpack (starpu_data_handle_t handle, void *ptr, size_t count)

Accessing Variable Data Interfaces

• #define STARPU_VARIABLE_GET_PTR(interface)
• #define STARPU_VARIABLE_GET_ELEM_SIZE(interface)
• #define STARPU_VARIABLE_GET_DEV_HANDLE(interface)
• #define STARPU_VARIABLE_GET_OFFSET(interface)
• size_t starpu_variable_get_elementsize (starpu_data_handle_t handle)
• uintptr_t starpu_variable_get_local_ptr (starpu_data_handle_t handle)

Accessing Vector Data Interfaces

• #define STARPU_VECTOR_GET_PTR(interface)
• #define STARPU_VECTOR_GET_DEV_HANDLE(interface)
• #define STARPU_VECTOR_GET_OFFSET(interface)
• #define STARPU_VECTOR_GET_NX(interface)
• #define STARPU_VECTOR_GET_ELEM_SIZE(interface)
• #define STARPU_VECTOR_GET_SLICE_BASE(interface)
• uint32_t starpu_vector_get_nx (starpu_data_handle_t handle)
• size_t starpu_vector_get_elementsize (starpu_data_handle_t handle)
• uintptr_t starpu_vector_get_local_ptr (starpu_data_handle_t handle)

Accessing Matrix Data Interfaces

• #define STARPU_MATRIX_GET_PTR(interface)
• #define STARPU_MATRIX_GET_DEV_HANDLE(interface)
• #define STARPU_MATRIX_GET_OFFSET(interface)
• #define STARPU_MATRIX_GET_NX(interface)
• #define STARPU_MATRIX_GET_NY(interface)
• #define STARPU_MATRIX_GET_LD(interface)
29.9 Data Interfaces

- #define STARPU_MATRIX_GET_ELEMSIZE(interface)
- uint32_t starpu_matrix_get_nx (starpu_data_handle_t handle)
- uint32_t starpu_matrix_get_ny (starpu_data_handle_t handle)
- uintptr_t starpu_matrix_get_local_ld (starpu_data_handle_t handle)
- size_t starpu_matrix_get_elemsize (starpu_data_handle_t handle)

Accessing Block Data Interfaces

- #define STARPU_BLOCK_GET_PTR(interface)
- #define STARPU_BLOCK_GET_DEV_HANDLE(interface)
- #define STARPU_BLOCK_GET_OFFSET(interface)
- #define STARPU_BLOCK_GET_NX(interface)
- #define STARPU_BLOCK_GET_NY(interface)
- #define STARPU_BLOCK_GET_NZ(interface)
- #define STARPU_BLOCK_GET_LDY(interface)
- #define STARPU_BLOCK_GET_LDZ(interface)
- #define STARPU_BLOCK_GET_ELEMSIZE(interface)
- uint32_t starpu_block_get_nx (starpu_data_handle_t handle)
- uint32_t starpu_block_get_ny (starpu_data_handle_t handle)
- uint32_t starpu_block_get_nz (starpu_data_handle_t handle)
- uint32_t starpu_block_get_local_ldy (starpu_data_handle_t handle)
- uint32_t starpu_block_get_local_ldz (starpu_data_handle_t handle)
- uintptr_t starpu_block_get_local_ptr (starpu_data_handle_t handle)
- size_t starpu_block_get_elemsize (starpu_data_handle_t handle)

Accessing BCSR Data Interfaces

- #define STARPU_BCSR_GET_NNZ(interface)
- #define STARPU_BCSR_GET_NZVAL(interface)
- #define STARPU_BCSR_GET_NZVAL_DEV_HANDLE(interface)
- #define STARPU_BCSR_GET_COLIND(interface)
- #define STARPU_BCSR_GET_COLIND_DEV_HANDLE(interface)
- #define STARPU_BCSR_GET_ROWPTR(interface)
- #define STARPU_BCSR_GET_ROWPTR_DEV_HANDLE(interface)
- #define STARPU_BCSR_GET_OFFSET
- uint32_t starpu_bcsr_get_nnz (starpu_data_handle_t handle)
- uint32_t starpu_bcsr_get_nrow (starpu_data_handle_t handle)
- uint32_t starpu_bcsr_get_firstentry (starpu_data_handle_t handle)
- uintptr_t starpu_bcsr_get_local_nzval (starpu_data_handle_t handle)
- uintptr_t starpu_bcsr_get_local_colind (starpu_data_handle_t handle)
- uint32_t starpu_bcsr_get_local_rowptr (starpu_data_handle_t handle)
- uint32_t starpu_bcsr_get_r (starpu_data_handle_t handle)
- uint32_t starpu_bcsr_get_c (starpu_data_handle_t handle)
- size_t starpu_bcsr_get_elemsize (starpu_data_handle_t handle)

Accessing CSR Data Interfaces

- #define STARPU_CSR_GET_NNZ(interface)
- #define STARPU_CSR_GET_NROW(interface)
- #define STARPU_CSR_GET_NZVAL(interface)
- #define STARPU_CSR_GET_NZVAL_DEV_HANDLE(interface)
- #define STARPU_CSR_GET_COLIND(interface)
- #define STARPU_CSR_GET_COLIND_DEV_HANDLE(interface)
- #define STARPU_CSR_GET_ROWPTR(interface)
- #define STARPU_CSR_GET_ROWPTR_DEV_HANDLE(interface)
- #define STARPU_CSR_GET_OFFSET
- uint32_t starpu_csr_get_nnz (starpu_data_handle_t handle)
- uint32_t starpu_csr_get_nrow (starpu_data_handle_t handle)
- uint32_t starpu_csr_get_firstentry (starpu_data_handle_t handle)
- uintptr_t starpu_csr_get_local_nzval (starpu_data_handle_t handle)
- uintptr_t starpu_csr_get_local_colind (starpu_data_handle_t handle)
- uint32_t starpu_csr_get_local_rowptr (starpu_data_handle_t handle)
- uint32_t starpu_csr_get_r (starpu_data_handle_t handle)
- uint32_t starpu_csr_get_c (starpu_data_handle_t handle)
- size_t starpu_csr_get_elemsize (starpu_data_handle_t handle)
• #define STARPU_CSR_GET_ROWPTR_DEV_HANDLE(interface)
• #define STARPU_CSR_GET_OFFSET
• #define STARPU_CSR_GET_FIRSTENTRY(interface)
• #define STARPU_CSR_GET_ELEM_SIZE(interface)
  
  uint32_t starpu_csr_get_nnz (starpu_data_handle_t handle)
  uint32_t starpu_csr_get_nrow (starpu_data_handle_t handle)
  uint32_t starpu_csr_get_firstentry (starpu_data_handle_t handle)
  uintptr_t starpu_csr_get_local_nzval (starpu_data_handle_t handle)
  uint32_t * starpu_csr_get_local_colind (starpu_data_handle_t handle)
  uint32_t * starpu_csr_get_local_rowptr (starpu_data_handle_t handle)
  size_t starpu_csr_get_elem_size (starpu_data_handle_t handle)

Accessing COO Data Interfaces

• #define STARPU_COO_GET_COLUMNS(interface)
• #define STARPU_COO_GET_COLUMNS_DEV_HANDLE(interface)
• #define STARPU_COO_GET_ROWS(interface)
• #define STARPU_COO_GET_ROWS_DEV_HANDLE(interface)
• #define STARPU_COO_GET_VALUES(interface)
• #define STARPU_COO_GET_VALUES_DEV_HANDLE(interface)
• #define STARPU_COO_GET_OFFSET
• #define STARPU_COO_GET_NX(interface)
• #define STARPU_COO_GET NY(interface)
• #define STARPU_COO_GET_NVALUES(interface)
• #define STARPU_COO_GET_ELEM_SIZE(interface)

Defining Interface

Applications can provide their own interface as shown in Defining A New Data Interface.

  • uintptr_t starpu_malloc_on_node_flags (unsigned dst_node, size_t size, int flags)
  • void starpu_free_on_node_flags (unsigned dst_node, uintptr_t addr, size_t size, int flags)
  • uintptr_t starpu_malloc_on_node (unsigned dst_node, size_t size)
  • void starpu_free_on_node (unsigned dst_node, uintptr_t addr, size_t size)
  • void starpu_malloc_on_node_set_default_flags (unsigned node, int flags)
  • int starpu_interface_copy (uintptr_t src, size_t src_offset, unsigned src_node, uintptr_t dst, size_t dst_offset, unsigned dst_node, size_t size, void *async_data)
  • void starpu_interface_start_driver_copy_async (unsigned src_node, unsigned dst_node, double *start)
  • void starpu_interface_end_driver_copy_async (unsigned src_node, unsigned dst_node, double start)
  • uint32_t starpu_hash_crc32c_be_n (const void *input, size_t n, uint32_t inputcrc)
  • uint32_t starpu_hash_crc32c (uint32_t inputcrc)
  • uint32_t starpu_hash_crc32c_string (const char *str, uint32_t inputcrc)
  • int starpu_data_interface_get_next_id (void)

29.9.1 Detailed Description

29.9.2 Data Structure Documentation

29.9.2.1 struct starpu_data_interface_ops

Per-interface data transfer methods.
29.9 Data Interfaces

- char * name

29.9.2.1.1 Field Documentation

29.9.2.1.1.1 register_data_handle

void(* starpu_data_interface_ops::register_data_handle)(starpu_data_handle_t handle, unsigned
home_node, void *data_interface)

Register an existing interface into a data handle.
This iterates over all memory nodes to initialize all fields of the data interface on each of them. Since data is not
allocated yet except on the home node, pointers should be left as NULL except on the
home_node, for which the
pointers should be copied from the given
data_interface, which was filled with the application's pointers.

29.9.2.1.1.2 allocate_data_on_node

starpu_ssize_t(* starpu_data_interface_ops::allocate_data_on_node)(void *data_interface, unsigned
node)

Allocate data for the interface on a given node. This should use starpu_malloc_on_node to perform the allocation(s),
and fill the pointers in the data interface. It should return the size of the allocated memory, or -ENOMEM if memory
could not be allocated.

29.9.2.1.1.3 free_data_on_node

void(* starpu_data_interface_ops::free_data_on_node)(void *data_interface, unsigned node)

Free data of the interface on a given node.

29.9.2.1.1.4 copy_methods

const struct starpu_data_copy_methods * starpu_data_interface_ops::copy_methods

This provides a series of methods for performing ram/cuda/opencl synchronous and asynchronous transfers.

29.9.2.1.1.5 handle_to_pointer

void *(* starpu_data_interface_ops::handle_to_pointer )(starpu_data_handle_t handle, unsigned
node)

Deprecated Use starpu_data_interface_ops::to_pointer instead. Return the current pointer (if any) for the handle
on the given node.
29.9.2.1.1.6 to_pointer

```c
void *(::starpu_data_interface_ops::to_pointer)(void *data_interface, unsigned node)
```

Return the current pointer (if any) for the given interface on the given node.

29.9.2.1.1.7 pointer_is_inside

```c
int *(::starpu_data_interface_ops::pointer_is_inside)(void *data_interface, unsigned node, void *pointer)
```

Return whether the given pointer is within the data for the given interface on the given node.

29.9.2.1.1.8 get_size

```c
size_t *(::starpu_data_interface_ops::get_size)(starpu_data_handle_t handle)
```

Return an estimation of the size of data, for performance models.

29.9.2.1.1.9 footprint

```c
uint32_t *(::starpu_data_interface_ops::footprint)(starpu_data_handle_t handle)
```

Return a 32bit footprint which characterizes the data size and layout (nx, ny, ld, elemsize, etc.)

29.9.2.1.1.10 compare

```c
int *(::starpu_data_interface_ops::compare)(void *data_interface_a, void *data_interface_b)
```

Compare the data size and layout of two interfaces (nx, ny, ld, elemsize, etc.). It should return 1 if the two interfaces size and layout match, and 0 otherwise.

29.9.2.1.1.11 display

```c
void *(::starpu_data_interface_ops::display)(starpu_data_handle_t handle, FILE *f)
```

Dump the sizes of a handle to a file.

29.9.2.1.1.12 describe

```c
starpu_ssize_t *(::starpu_data_interface_ops::describe)(void *data_interface, char *buf, size_t size)
```

Describe the data into a string in a brief way, such as one letter to describe the type of data, and the data dimensions.

29.9.2.1.1.13 interfaceid

```c
enum starpu_data_interface_id starpu_data_interface_ops::interfaceid
```

An identifier that is unique to each interface.

29.9.2.1.1.14 interface_size

```c
size_t starpu_data_interface_ops::interface_size
```

The size of the interface data descriptor.

29.9.2.1.1.15 is_multiformat

```c
char starpu_data_interface_ops::is_multiformat
todo
```

29.9.2.1.1.16 dontcache

```c
char starpu_data_interface_ops::dontcache
todo
```

If set to non-zero, StarPU will never try to reuse an allocated buffer for a different handle. This can be notably useful for application-defined interfaces which have a dynamic size, and for which it thus does not make sense to reuse the buffer since it will probably not have the proper size.

29.9.2.1.1.17 get_mf_ops

```c
struct starpu_multiformat_data_interface_ops **(::starpu_data_interface_ops::get_mf_ops)(void *data_interface)
todo
```

29.9.2.1.1.18 pack_data

```c
int *(::starpu_data_interface_ops::pack_data)(starpu_data_handle_t handle, unsigned node, void **ptr, starpu_ssize_t *count)
```

Pack the data handle into a contiguous buffer at the address allocated with starpu_malloc_flags(ptr, size, 0) (and thus returned in ptr) and set the size of the newly created buffer in count. If ptr is NULL,
the function should not copy the data in the buffer but just set count to the size of the buffer which would have been allocated. The special value -1 indicates the size is yet unknown.

### 29.9.2.2 struct starpu_data_copy_methods

Defines the per-interface methods. If the starpu_data_copy_methods::any_to_any method is provided, it will be used by default if no specific method is provided. It can still be useful to provide more specific method in case of e.g. available particular CUDA or OpenCL support.

#### Data Fields

- int(* can_copy ) (void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, unsigned handling_node)
- int(* ram_to_ram ) (void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
- int(* ram_to_cuda ) (void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)

- int(* mpi_ms_to_mpi_ms_async ) (void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, void *event)
• int(* ram_to_mic_async ) (void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
• int(* mic_to_ram_async ) (void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
• int(* any_to_any ) (void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, void *async_data)

29.9.2.2.1 Field Documentation

29.9.2.2.1.1 can_copy
int(* starpu_data_copy_methods::can_copy)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, unsigned handling_node)
If defined, allows the interface to declare whether it supports transferring from src_interface on node src_node to dst_interface on node dst_node, run from node handling_node. If not defined, it is assumed that the interface supports all transfers.

29.9.2.2.1.2 ram_to_ram
int(* starpu_data_copy_methods::ram_to_ram)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
Define how to copy data from the src_interface interface on the src_node CPU node to the dst_interface interface on the dst_node CPU node. Return 0 on success.

29.9.2.2.1.3 ram_to_cuda
int(* starpu_data_copy_methods::ram_to_cuda)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
Define how to copy data from the src_interface interface on the src_node CPU node to the dst_interface interface on the dst_node CUDA node. Return 0 on success.

29.9.2.2.1.4 ram_to_opencl
int(* starpu_data_copy_methods::ram_to_opencl)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
Define how to copy data from the src_interface interface on the src_node CPU node to the dst_interface interface on the dst_node OpenCL node. Return 0 on success.

29.9.2.2.1.5 ram_to_mic
int(* starpu_data_copy_methods::ram_to_mic)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
Define how to copy data from the src_interface interface on the src_node CPU node to the dst_interface interface on the dst_node MIC node. Return 0 on success.

29.9.2.2.1.6 cuda_to_ram
int(* starpu_data_copy_methods::cuda_to_ram)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
Define how to copy data from the src_interface interface on the src_node CUDA node to the dst_interface interface on the dst_node CPU node. Return 0 on success.

29.9.2.2.1.7 cuda_to_cuda
int(* starpu_data_copy_methods::cuda_to_cuda)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
Define how to copy data from the src_interface interface on the src_node CUDA node to the dst_interface interface on the dst_node CUDA node. Return 0 on success.

29.9.2.2.1.8 cuda_to_opencl
int(* starpu_data_copy_methods::cuda_to_opencl)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
Define how to copy data from the src_interface interface on the src_node CUDA node to the dst_interface interface on the dst_node OpenCL node. Return 0 on success.

29.9.2.2.1.9 opencl_to_ram
int(* starpu_data_copy_methods::opencl_to_ram)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
Define how to copy data from the `src_interface` interface on the `src_node` OpenCL node to the `dst_interface` interface on the `dst_node` CPU node. Return 0 on success.

**29.9.2.2.1.10  opencl_to_cud**

```c
int(* starpu_data_copy_methods::opencl_to_cuda)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` OpenCL node to the `dst_interface` interface on the `dst_node` CUDA node. Return 0 on success.

**29.9.2.2.1.11  opencl_to_opencl**

```c
int(* starpu_data_copy_methods::opencl_to_opencl)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` OpenCL node to the `dst_interface` interface on the `dst_node` OpenCL node. Return 0 on success.

**29.9.2.2.1.12  mic_to_ram**

```c
int(* starpu_data_copy_methods::mic_to_ram)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` MIC node to the `dst_interface` interface on the `dst_node` CPU node. Return 0 on success.

**29.9.2.2.1.13  scc_src_to_sink**

```c
int(* starpu_data_copy_methods::scc_src_to_sink)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` node to the `dst_interface` interface on the `dst_node` node. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

**29.9.2.2.1.14  scc_sink_to_src**

```c
int(* starpu_data_copy_methods::scc_sink_to_src)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` node to the `dst_interface` interface on the `dst_node` node. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

**29.9.2.2.1.15  scc_sink_to_sink**

```c
int(* starpu_data_copy_methods::scc_sink_to_sink)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` node to the `dst_interface` interface on the `dst_node` node. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

**29.9.2.2.1.16  ram_to_mpi_ms**

```c
int(* starpu_data_copy_methods::ram_to_mpi_ms)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` CPU node to the `dst_interface` interface on the `dst_node` MPI Slave node. Return 0 on success.

**29.9.2.2.1.17  mpi_ms_to_ram**

```c
int(* starpu_data_copy_methods::mpi_ms_to_ram)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` MPI Slave node to the `dst_interface` interface on the `dst_node` CPU node. Return 0 on success.

**29.9.2.2.1.18  mpi_ms_to_mpi_ms**

```c
int(* starpu_data_copy_methods::mpi_ms_to_mpi_ms)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node)
```

Define how to copy data from the `src_interface` interface on the `src_node` MPI Slave node to the `dst_interface` interface on the `dst_node` MPI Slave node. Return 0 on success.
29.9.2.2.1.19  ram_to_cuda_async

int(* starpu_data_copy_methods::ram_to_cuda_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, cudaStream_t stream)

Define how to copy data from the src_interface interface on the src_node CPU node to the dst←interface interface on the dst_node CUDA node, using the given stream. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.20  cuda_to_ram_async

int(* starpu_data_copy_methods::cuda_to_ram_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, cudaStream_t stream)

Define how to copy data from the src_interface interface on the src_node CUDA node to the dst←interface interface on the dst_node CPU node, using the given stream. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.21  cuda_to_cude_async

int(* starpu_data_copy_methods::cuda_to_cude_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, cudaStream_t stream)

Define how to copy data from the src_interface interface on the src_node CUDA node to the dst←interface interface on the dst_node CUDA node, using the given stream. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.22  ram_to_opencl_async

int(* starpu_data_copy_methods::ram_to_opencl_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, cl_event *event)

Define how to copy data from the src_interface interface on the src_node CPU node to the dst←interface interface on the dst_node OpenCL node, by recording in event, a pointer to a cl_event, the event of the last submitted transfer. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.23  opencl_to_ram_async

int(* starpu_data_copy_methods::opencl_to_ram_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, cl_event *event)

Define how to copy data from the src_interface interface on the src_node OpenCL node to the dst←interface interface on the dst_node CPU node, by recording in event, a pointer to a cl_event, the event of the last submitted transfer. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.24  opencl_to_opencl_async

int(* starpu_data_copy_methods::opencl_to_opencl_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, cl_event *event)

Define how to copy data from the src_interface interface on the src_node OpenCL node to the dst←interface interface on the dst_node OpenCL node, by recording in event, a pointer to a cl_event, the event of the last submitted transfer. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.25  ram_to_mpi_ms_async

int(* starpu_data_copy_methods::ram_to_mpi_ms_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, void *event)

Define how to copy data from the src_interface interface on the src_node CPU node to the dst←interface interface on the dst_node MPI Slave node, with the given even. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.26  mpi_ms_to_ram_async

int(* starpu_data_copy_methods::mpi_ms_to_ram_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, void *event)
Define how to copy data from the src_interface interface on the src_node MPI Slave node to the dst←_interface interface on the dst_node CPU node, with the given event. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.27 mpi_ms_to_mpi_ms_async

int(* starpu_data_copy_methods::mpi_ms_to_mpi_ms_async)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, void *event)

Define how to copy data from the src_interface interface on the src_node MPI Slave node to the dst←_interface interface on the dst_node MPI Slave node, using the given stream. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.28 ram_to_mic_async

int(* starpu_data_copy_methods::ram_to_mic_async)(void *src_intreface, unsigned src_node, void *dst_interface, unsigned dst_node)

Define how to copy data from the src_interface interface on the src_node CPU node to the dst←_interface interface on the dst_node MIC node. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.29 mic_to_ram_async

int(* starpu_data_copy_methods::mic_to_ram_async)(void *src_intreface, unsigned src_node, void *dst_interface, unsigned dst_node)

Define how to copy data from the src_interface interface on the src_node MIC node to the dst←_interface interface on the dst_node CPU node. Must return 0 if the transfer was actually completed completely synchronously, or -EAGAIN if at least some transfers are still ongoing and should be awaited for by the core.

29.9.2.2.1.30 any_to_any

int(* starpu_data_copy_methods::any_to_any)(void *src_interface, unsigned src_node, void *dst_interface, unsigned dst_node, void *async_data)

Define how to copy data from the src_interface interface on the src_node node to the dst_interface interface on the dst_node node. This is meant to be implemented through the starpu_interface_copy() helper, to which async_data should be passed as such, and will be used to manage asynchronicity. This must return -EAGAIN if any of the starpu_interface_copy() calls has returned -EAGAIN (i.e. at least some transfer is still ongoing), and return 0 otherwise.

29.9.2.3 struct starpu_variable_interface

Variable interface for a single data (not a vector, a matrix, a list, ...)

Data Fields

<table>
<thead>
<tr>
<th>enum starpu_data_interface_id</th>
<th>id</th>
<th>Identifier of the interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>uintptr_t</td>
<td>ptr</td>
<td>local pointer of the variable</td>
</tr>
<tr>
<td>uintptr_t</td>
<td>dev_handle</td>
<td>device handle of the variable.</td>
</tr>
<tr>
<td>size_t</td>
<td>offset</td>
<td>offset in the variable</td>
</tr>
<tr>
<td>size_t</td>
<td>elemsize</td>
<td>size of the variable</td>
</tr>
</tbody>
</table>

29.9.2.4 struct starpu_vector_interface

Vector interface

Data Fields

<table>
<thead>
<tr>
<th>enum starpu_data_interface_id</th>
<th>id</th>
<th>Identifier of the interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>uintptr_t</td>
<td>ptr</td>
<td>local pointer of the vector</td>
</tr>
</tbody>
</table>
Data Fields

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uintptr_t</td>
<td>dev_handle</td>
<td>device handle of the vector.</td>
</tr>
<tr>
<td>size_t</td>
<td>offset</td>
<td>offset in the vector</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nx</td>
<td>number of elements on the x-axis of the vector</td>
</tr>
<tr>
<td>size_t</td>
<td>elemsize</td>
<td>size of the elements of the vector</td>
</tr>
<tr>
<td>uint32_t</td>
<td>slice_base</td>
<td>vector slice base, used by the StarPU OpenMP runtime support</td>
</tr>
</tbody>
</table>

### 29.9.2.5 struct starpu_matrix_interface

Matrix interface for dense matrices

Data Fields

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enum starpu_data_interface_id</td>
<td>id</td>
<td>Identifier of the interface</td>
</tr>
<tr>
<td>uintptr_t</td>
<td>ptr</td>
<td>local pointer of the matrix</td>
</tr>
<tr>
<td>uintptr_t</td>
<td>dev_handle</td>
<td>device handle of the matrix</td>
</tr>
<tr>
<td>size_t</td>
<td>offset</td>
<td>offset in the matrix</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nx</td>
<td>number of elements on the x-axis of the matrix</td>
</tr>
<tr>
<td>uint32_t</td>
<td>ny</td>
<td>number of elements on the y-axis of the matrix</td>
</tr>
<tr>
<td>uint32_t</td>
<td>ld</td>
<td>number of elements between each row of the matrix. Maybe be equal to starpu_matrix_interface::nx when there is no padding.</td>
</tr>
<tr>
<td>size_t</td>
<td>elemsize</td>
<td>size of the elements of the matrix</td>
</tr>
</tbody>
</table>

### 29.9.2.6 struct starpu_block_interface

Block interface for 3D dense blocks

Data Fields

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enum starpu_data_interface_id</td>
<td>id</td>
<td>Identifier of the interface</td>
</tr>
<tr>
<td>uintptr_t</td>
<td>ptr</td>
<td>local pointer of the block</td>
</tr>
<tr>
<td>uintptr_t</td>
<td>dev_handle</td>
<td>device handle of the block</td>
</tr>
<tr>
<td>size_t</td>
<td>offset</td>
<td>offset in the block</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nx</td>
<td>number of elements on the x-axis of the block</td>
</tr>
<tr>
<td>uint32_t</td>
<td>ny</td>
<td>number of elements on the y-axis of the block</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nz</td>
<td>number of elements on the z-axis of the block</td>
</tr>
<tr>
<td>uint32_t</td>
<td>ldy</td>
<td>number of elements between two lines</td>
</tr>
<tr>
<td>uint32_t</td>
<td>ldz</td>
<td>number of elements between two planes</td>
</tr>
<tr>
<td>size_t</td>
<td>elemsize</td>
<td>size of the elements of the block</td>
</tr>
</tbody>
</table>

### 29.9.2.7 struct starpu_bcsr_interface

BCSR interface for sparse matrices (blocked compressed sparse row representation)

Data Fields

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enum starpu_data_interface_id</td>
<td>id</td>
<td>Identifier of the interface</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nnz</td>
<td>number of non-zero BLOCKS</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nrow</td>
<td>number of rows (in terms of BLOCKS)</td>
</tr>
</tbody>
</table>
29.9 Data Interfaces

Data Fields

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uintptr_t</td>
<td>nzval</td>
<td>non-zero values</td>
</tr>
<tr>
<td>uint32_t</td>
<td>colind</td>
<td>array of nnz elements, colind[i] is the block-column index for block i in nzval</td>
</tr>
<tr>
<td>uint32_t</td>
<td>rowptr</td>
<td>array of nrow+1 elements, rowptr[i] is the block-index (in nzval) of the first block of row i. By convention, rowptr[nrow] is the number of blocks, this allows an easier access of the matrix's elements for the kernels.</td>
</tr>
<tr>
<td>uint32_t</td>
<td>firstentry</td>
<td>k for k-based indexing (0 or 1 usually). Also useful when partitionning the matrix.</td>
</tr>
<tr>
<td>uint32_t</td>
<td>r</td>
<td>height of the blocks</td>
</tr>
<tr>
<td>uint32_t</td>
<td>c</td>
<td>width of the blocks</td>
</tr>
<tr>
<td>size_t</td>
<td>elemsize</td>
<td>size of the elements of the matrix</td>
</tr>
</tbody>
</table>

29.9.2.8 struct starpu_csr_interface

CSR interface for sparse matrices (compressed sparse row representation)

Data Fields

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enum</td>
<td>id</td>
<td>Identifier of the interface</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nnz</td>
<td>number of non-zero entries</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nrow</td>
<td>number of rows</td>
</tr>
<tr>
<td>uintptr_t</td>
<td>nzval</td>
<td>non-zero values</td>
</tr>
<tr>
<td>uint32_t</td>
<td>colind</td>
<td>position of non-zero entries on the row</td>
</tr>
<tr>
<td>uint32_t</td>
<td>rowptr</td>
<td>index (in nzval) of the first entry of the row</td>
</tr>
<tr>
<td>uint32_t</td>
<td>firstentry</td>
<td>k for k-based indexing (0 or 1 usually). Also useful when partitionning the matrix.</td>
</tr>
<tr>
<td>size_t</td>
<td>elemsize</td>
<td>size of the elements of the matrix</td>
</tr>
</tbody>
</table>

29.9.2.9 struct starpu_coo_interface

COO Matrices

Data Fields

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enum</td>
<td>id</td>
<td>Identifier of the interface</td>
</tr>
<tr>
<td>uint32_t</td>
<td>columns</td>
<td>column array of the matrix</td>
</tr>
<tr>
<td>uint32_t</td>
<td>rows</td>
<td>row array of the matrix</td>
</tr>
<tr>
<td>uintptr_t</td>
<td>values</td>
<td>values of the matrix</td>
</tr>
<tr>
<td>uint32_t</td>
<td>nx</td>
<td>number of elements on the x-axis of the matrix</td>
</tr>
<tr>
<td>uint32_t</td>
<td>ny</td>
<td>number of elements on the y-axis of the matrix</td>
</tr>
<tr>
<td>uint32_t</td>
<td>n_values</td>
<td>number of values registered in the matrix</td>
</tr>
<tr>
<td>size_t</td>
<td>elemsize</td>
<td>size of the elements of the matrix</td>
</tr>
</tbody>
</table>

29.9.3 Macro Definition Documentation
29.9.3.1 STARPU_VARIABLE_GET_PTR

#define STARPU_VARIABLE_GET_PTR(interface)
Return a pointer to the variable designated by interface.

29.9.3.2 STARPU_VARIABLE_GET_ELEMSIZE

#define STARPU_VARIABLE_GET_ELEMSIZE(interface)
Return the size of the variable designated by interface.

29.9.3.3 STARPU_VARIABLE_GET_DEV_HANDLE

#define STARPU_VARIABLE_GET_DEV_HANDLE(interface)
Return a device handle for the variable designated by interface, to be used with OpenCL. The offset documented below has to be used in addition to this.

29.9.3.4 STARPU_VARIABLE_GET_OFFSET

#define STARPU_VARIABLE_GET_OFFSET(interface)
Return the offset in the variable designated by interface, to be used with the device handle.

29.9.3.5 STARPU_VECTOR_GET_PTR

#define STARPU_VECTOR_GET_PTR(interface)
Return a pointer to the array designated by interface, valid on CPUs and CUDA only. For OpenCL, the device handle and offset need to be used instead.

29.9.3.6 STARPU_VECTOR_GET_DEV_HANDLE

#define STARPU_VECTOR_GET_DEV_HANDLE(interface)
Return a device handle for the array designated by interface, to be used with OpenCL. The offset documented below has to be used in addition to this.

29.9.3.7 STARPU_VECTOR_GET_OFFSET

#define STARPU_VECTOR_GET_OFFSET(interface)
Return the offset in the array designated by interface, to be used with the device handle.

29.9.3.8 STARPU_VECTOR_GET_NX

#define STARPU_VECTOR_GET_NX(interface)
Return the number of elements registered into the array designated by interface.

29.9.3.9 STARPU_VECTOR_GET_ELEMSIZE

#define STARPU_VECTOR_GET_ELEMSIZE(interface)
Return the size of each element of the array designated by interface.
29.9.3.10 \texttt{STARPU\_VECTOR\_GET\_SLICE\_BASE}

```c
#define STARPU_VECTOR_GET_SLICE_BASE(interface)
```

Return the OpenMP slice base annotation of each element of the array designated by \texttt{interface}.

See also \texttt{starpu\_omp\_vector\_annotate}

29.9.3.11 \texttt{STARPU\_MATRIX\_GET\_PTR}

```c
#define STARPU_MATRIX_GET_PTR(interface)
```

Return a pointer to the matrix designated by \texttt{interface}, valid on CPUs and CUDA devices only. For OpenCL devices, the device handle and offset need to be used instead.

29.9.3.12 \texttt{STARPU\_MATRIX\_GET\_DEV\_HANDLE}

```c
#define STARPU_MATRIX_GET_DEV_HANDLE(interface)
```

Return a device handle for the matrix designated by \texttt{interface}, to be used with OpenCL. The offset documented below has to be used in addition to this.

29.9.3.13 \texttt{STARPU\_MATRIX\_GET\_OFFSET}

```c
#define STARPU_MATRIX_GET_OFFSET(interface)
```

Return the offset in the matrix designated by \texttt{interface}, to be used with the device handle.

29.9.3.14 \texttt{STARPU\_MATRIX\_GET\_NX}

```c
#define STARPU_MATRIX_GET_NX(interface)
```

Return the number of elements on the x-axis of the matrix designated by \texttt{interface}.

29.9.3.15 \texttt{STARPU\_MATRIX\_GET\_NY}

```c
#define STARPU_MATRIX_GET_NY(interface)
```

Return the number of elements on the y-axis of the matrix designated by \texttt{interface}.

29.9.3.16 \texttt{STARPU\_MATRIX\_GET\_LD}

```c
#define STARPU_MATRIX_GET_LD(interface)
```

Return the number of elements between each row of the matrix designated by \texttt{interface}. May be equal to \texttt{nx} when there is no padding.

29.9.3.17 \texttt{STARPU\_MATRIX\_GET\_ELEMSIZE}

```c
#define STARPU_MATRIX_GET_ELEMSIZE(interface)
```

Return the size of the elements registered into the matrix designated by \texttt{interface}.

29.9.3.18 \texttt{STARPU\_BLOCK\_GET\_PTR}

```c
#define STARPU_BLOCK_GET_PTR(interface)
```

Return a pointer to the block designated by \texttt{interface}.

Generated by Doxygen
29.9.3.19 STARPU_BLOCK_GET_DEV_HANDLE

#define STARPU_BLOCK_GET_DEV_HANDLE(
    interface
)

Return a device handle for the block designated by interface, to be used on OpenCL. The offset document below has to be used in addition to this.

29.9.3.20 STARPU_BLOCK_GET_OFFSET

#define STARPU_BLOCK_GET_OFFSET(
    interface
)

Return the offset in the block designated by interface, to be used with the device handle.

29.9.3.21 STARPU_BLOCK_GET_NX

#define STARPU_BLOCK_GET_NX(
    interface
)

Return the number of elements on the x-axis of the block designated by interface.

29.9.3.22 STARPU_BLOCK_GET_NY

#define STARPU_BLOCK_GET_NY(
    interface
)

Return the number of elements on the y-axis of the block designated by interface.

29.9.3.23 STARPU_BLOCK_GET_NZ

#define STARPU_BLOCK_GET_NZ(
    interface
)

Return the number of elements on the z-axis of the block designated by interface.

29.9.3.24 STARPU_BLOCK_GET_LDY

#define STARPU_BLOCK_GET_LDY(
    interface
)

Return the number of elements between each row of the block designated by interface. May be equal to nx when there is no padding.

29.9.3.25 STARPU_BLOCK_GET_LDZ

#define STARPU_BLOCK_GET_LDZ(
    interface
)

Return the number of elements between each z plane of the block designated by interface. May be equal to nx*ny when there is no padding.

29.9.3.26 STARPU_BLOCK_GET_ELEMSIZE

#define STARPU_BLOCK_GET_ELEMSIZE(
    interface
)

Return the size of the elements of the block designated by interface.

29.9.3.27 STARPU_BCSR_GET_NNZ

#define STARPU_BCSR_GET_NNZ(
    interface
)

Return the number of non-zero values in the matrix designated by interface.
29.9.3.28  **STARPU_BCSR_GET_NZVAL**

```c
#define STARPU_BCSR_GET_NZVAL(interface)
```

Return a pointer to the non-zero values of the matrix designated by `interface`.

29.9.3.29  **STARPU_BCSR_GET_NZVAL_DEV_HANDLE**

```c
#define STARPU_BCSR_GET_NZVAL_DEV_HANDLE(interface)
```

Return a device handle for the array of non-zero values in the matrix designated by `interface`. The offset documented below has to be used in addition to this.

29.9.3.30  **STARPU_BCSR_GET_COLIND**

```c
#define STARPU_BCSR_GET_COLIND(interface)
```

Return a pointer to the column index of the matrix designated by `interface`.

29.9.3.31  **STARPU_BCSR_GET_COLIND_DEV_HANDLE**

```c
#define STARPU_BCSR_GET_COLIND_DEV_HANDLE(interface)
```

Return a device handle for the column index of the matrix designated by `interface`. The offset documented below has to be used in addition to this.

29.9.3.32  **STARPU_BCSR_GET_ROWPTR**

```c
#define STARPU_BCSR_GET_ROWPTR(interface)
```

Return a pointer to the row pointer array of the matrix designated by `interface`.

29.9.3.33  **STARPU_BCSR_GET_ROWPTR_DEV_HANDLE**

```c
#define STARPU_BCSR_GET_ROWPTR_DEV_HANDLE(interface)
```

Return a device handle for the row pointer array of the matrix designated by `interface`. The offset documented below has to be used in addition to this.

29.9.3.34  **STARPU_BCSR_GET_OFFSET**

```c
#define STARPU_BCSR_GET_OFFSET
```

Return the offset in the arrays (coling, rowptr, nzval) of the matrix designated by `interface`, to be used with the device handles.

29.9.3.35  **STARPU_CSR_GET_NNZ**

```c
#define STARPU_CSR_GET_NNZ(interface)
```

Return the number of non-zero values in the matrix designated by `interface`.

29.9.3.36  **STARPU_CSR_GET_NROW**

```c
#define STARPU_CSR_GET_NROW(interface)
```

Return the size of the row pointer array of the matrix designated by `interface`.

---

Generated by Doxygen
29.9.37 STARPU_CSR_GET_NZVAL

#define STARPU_CSR_GET_NZVAL( interface )

Return a pointer to the non-zero values of the matrix designated by interface.

29.9.38 STARPU_CSR_GET_NZVAL_DEV_HANDLE

#define STARPU_CSR_GET_NZVAL_DEV_HANDLE( interface )

Return a device handle for the array of non-zero values in the matrix designated by interface. The offset documented below has to be used in addition to this.

29.9.39 STARPU_CSR_GET_COLIND

#define STARPU_CSR_GET_COLIND( interface )

Return a pointer to the column index of the matrix designated by interface.

29.9.40 STARPU_CSR_GET_COLIND_DEV_HANDLE

#define STARPU_CSR_GET_COLIND_DEV_HANDLE( interface )

Return a device handle for the column index of the matrix designated by interface. The offset documented below has to be used in addition to this.

29.9.41 STARPU_CSR_GET_ROWPTR

#define STARPU_CSR_GET_ROWPTR( interface )

Return a pointer to the row pointer array of the matrix designated by interface.

29.9.42 STARPU_CSR_GET_ROWPTR_DEV_HANDLE

#define STARPU_CSR_GET_ROWPTR_DEV_HANDLE( interface )

Return a device handle for the row pointer array of the matrix designated by interface. The offset documented below has to be used in addition to this.

29.9.43 STARPU_CSR_GET_OFFSET

#define STARPU_CSR_GET_OFFSET

Return the offset in the arrays (colind, rowptr, nzval) of the matrix designated by interface, to be used with the device handles.

29.9.44 STARPU_CSR_GET_FIRSTENTRY

#define STARPU_CSR_GET_FIRSTENTRY( interface )

Return the index at which all arrays (the column indexes, the row pointers...) of the interface start.

29.9.45 STARPU_CSR_GET_ELEMSIZE

#define STARPU_CSR_GET_ELEMSIZE( interface )

Return the size of the elements registered into the matrix designated by interface.
29.9 Data Interfaces

29.9.3.46 STARPU_COO_GET_COLUMNS
#define STARPU_COO_GET_COLUMNS(interface)
Return a pointer to the column array of the matrix designated by interface.

29.9.3.47 STARPU_COO_GET_COLUMNS_DEV_HANDLE
#define STARPU_COO_GET_COLUMNS_DEV_HANDLE(interface)
Return a device handle for the column array of the matrix designated by interface, to be used with OpenCL. The offset documented below has to be used in addition to this.

29.9.3.48 STARPU_COO_GET_ROWS
#define STARPU_COO_GET_ROWS(interface)
Return a pointer to the rows array of the matrix designated by interface.

29.9.3.49 STARPU_COO_GET_ROWS_DEV_HANDLE
#define STARPU_COO_GET_ROWS_DEV_HANDLE(interface)
Return a device handle for the row array of the matrix designated by interface, to be used on OpenCL. The offset documented below has to be used in addition to this.

29.9.3.50 STARPU_COO_GET_VALUES
#define STARPU_COO_GET_VALUES(interface)
Return a pointer to the values array of the matrix designated by interface.

29.9.3.51 STARPU_COO_GET_VALUES_DEV_HANDLE
#define STARPU_COO_GET_VALUES_DEV_HANDLE(interface)
Return a device handle for the value array of the matrix designated by interface, to be used on OpenCL. The offset documented below has to be used in addition to this.

29.9.3.52 STARPU_COO_GET_OFFSET
#define STARPU_COO_GET_OFFSET
Return the offset in the arrays of the COO matrix designated by interface.

29.9.3.53 STARPU_COO_GET_NX
#define STARPU_COO_GET_NX(interface)
Return the number of elements on the x-axis of the matrix designated by interface.

29.9.3.54 STARPU_COO_GET_NY
#define STARPU_COO_GET_NY(interface)
Return the number of elements on the y-axis of the matrix designated by interface.

29.9.3.55 STARPU_COO_GET_NVALUES
#define STARPU_COO_GET_NVALUES(interface)
Return the number of values registered in the matrix designated by interface.
### 29.9.3.56 STARPU_COO_GET_ELEMSIZE

```c
#define STARPU_COO_GET_ELEMSIZE(
    interface
)
```

Return the size of the elements registered into the matrix designated by `interface`.

### 29.9.4 Enumeration Type Documentation

#### 29.9.4.1 starpu_data_interface_id

```c
eenum starpu_data_interface_id
```

Identifier for all predefined StarPU data interfaces

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STARPU_UNKNOWN_INTERFACE_ID</td>
<td>Unknown interface</td>
</tr>
<tr>
<td>STARPU_MATRIX_INTERFACE_ID</td>
<td>Identifier for the matrix data interface</td>
</tr>
<tr>
<td>STARPU_BLOCK_INTERFACE_ID</td>
<td>Identifier for block data interface</td>
</tr>
<tr>
<td>STARPU_VECTOR_INTERFACE_ID</td>
<td>Identifier for the vector data interface</td>
</tr>
<tr>
<td>STARPU_CSR_INTERFACE_ID</td>
<td>Identifier for the csr data interface</td>
</tr>
<tr>
<td>STARPU_BCSR_INTERFACE_ID</td>
<td>Identifier for the bcsr data interface</td>
</tr>
<tr>
<td>STARPU_VARIABLE_INTERFACE_ID</td>
<td>Identifier for the variable data interface</td>
</tr>
<tr>
<td>STARPU_VOID_INTERFACE_ID</td>
<td>Identifier for the void data interface</td>
</tr>
<tr>
<td>STARPU_MULTIFORMAT_INTERFACE_ID</td>
<td>Identifier for the multiformat data interface</td>
</tr>
<tr>
<td>STARPU_COO_INTERFACE_ID</td>
<td>Identifier for the coo data interface</td>
</tr>
<tr>
<td>STARPU_MAX_INTERFACE_ID</td>
<td>Maximum number of data interfaces</td>
</tr>
</tbody>
</table>

### 29.9.5 Function Documentation

#### 29.9.5.1 starpu_void_data_register()

```c
void starpu_void_data_register (
    starpu_data_handle_t * handle
)
```

Register a void interface. There is no data really associated to that interface, but it may be used as a synchronization mechanism. It also permits to express an abstract piece of data that is managed by the application internally: this makes it possible to forbid the concurrent execution of different tasks accessing the same void data in read-write concurrently.

#### 29.9.5.2 starpu_variable_data_register()

```c
void starpu_variable_data_register ( 
    starpu_data_handle_t * handle,
    int home_node,
    uintptr_t ptr,
    size_t size
)
```

Register the `size` byte element pointed to by `ptr`, which is typically a scalar, and initialize `handle` to represent this data item.

Here an example of how to use the function.

```c
float var = 42.0;
starpu_data_handle_t var_handle;
starpu_variable_data_register(&var_handle, STARPU_MAIN_RAM, ( uintptr_t)&var, sizeof(var));
```
29.9.5.3  

```c
void starpu_variable_ptr_register (
    starpu_data_handle_t handle,
    unsigned node,
    uintptr_t ptr,
    uintptr_t dev_handle,
    size_t offset
)
```

Register into the handle that to store data on node node it should use the buffer located at ptr, or device handle dev_handle and offset offset (for OpenCL, notably)

29.9.5.4  

```c
void starpu_vector_data_register (
    starpu_data_handle_t * handle,
    int home_node,
    uintptr_t ptr,
    uint32_t nx,
    size_t elemsize
)
```

Register the nx elemsize-byte elements pointed to by ptr and initialize handle to represent it.

Here an example of how to use the function.

```c
float vector[NX];
starpu_data_handle_t vector_handle;
starpu_vector_data_register(&vector_handle, STARPU_MAIN_RAM, (uintptr_t)vector, NX, sizeof(vector[0]));
```

29.9.5.5  

```c
void starpu_vector_ptr_register (
    starpu_data_handle_t handle,
    unsigned node,
    uintptr_t ptr,
    uintptr_t dev_handle,
    size_t offset
)
```

Register into the handle that to store data on node node it should use the buffer located at ptr, or device handle dev_handle and offset offset (for OpenCL, notably)

29.9.5.6  

```c
void starpu_matrix_data_register (
    starpu_data_handle_t * handle,
    int home_node,
    uintptr_t ptr,
    uint32_t ld,
    uint32_t nx,
    uint32_t ny,
    size_t elemsize
)
```

Register the nx x ny 2D matrix of elemsize-byte elements pointed by ptr and initialize handle to represent it. ld specifies the number of elements between rows. a value greater than nx adds padding, which can be useful for alignment purposes.

Here an example of how to use the function.

```c
float *matrix;
starpu_data_handle_t matrix_handle;
matrix = (float*)malloc(width * height * sizeof(float));
starpu_matrix_data_register(matrix_handle, STARPU_MAIN_RAM, (uintptr_t)matrix, width, height, sizeof(float));
```
29.9.5.7  starpu_matrix_ptr_register()

```
void starpu_matrix_ptr_register (  
  starpu_data_handle_t handle,  
  unsigned node,  
  uintptr_t ptr,  
  uintptr_t dev_handle,  
  size_t offset,  
  uint32_t ld )
```

Register into the handle that to store data on node node it should use the buffer located at ptr, or device handle dev_handle and offset offset (for OpenCL, notably), with ld elements between rows.

29.9.5.8  starpu_block_data_register()

```
void starpu_block_data_register (  
  starpu_data_handle_t * handle,  
  int home_node,  
  uintptr_t ptr,  
  uint32_t ldy,  
  uint32_t ldz,  
  uint32_t nx,  
  uint32_t ny,  
  uint32_t nz,  
  size_t elemsize )
```

Register the nx x ny x nz 3D matrix of elemsize byte elements pointed by ptr and initialize handle to represent it. Again, ldy and ldz specify the number of elements between rows and between z planes. Here an example of how to use the function.

```c
float *block;
starpu_data_handle_t block_handle;
block = (float*)malloc(nx*ny*nz*sizeof(float));
starpu_block_data_register(&block_handle, STARPU_MAIN_RAM, (  
  uintptr_t)block, nx, nx*ny, nx, ny, nz, sizeof(float));
```

29.9.5.9  starpu_block_ptr_register()

```
void starpu_block_ptr_register (  
  starpu_data_handle_t handle,  
  unsigned node,  
  uintptr_t ptr,  
  uintptr_t dev_handle,  
  size_t offset,  
  uint32_t ldy,  
  uint32_t ldz )
```

Register into the handle that to store data on node node it should use the buffer located at ptr, or device handle dev_handle and offset offset (for OpenCL, notably), with ldy elements between rows and ldz elements between z planes.

29.9.5.10  starpu_bcsr_data_register()

```
void starpu_bcsr_data_register (  
  starpu_data_handle_t * handle,  
  int home_node,  
  uint32_t nnz,  
  uint32_t nrow,  
  uintptr_t nzval,  
  uint32_t * colind,  
  uint32_t * rowptr,  
  uint32_t firstentry,  
```

Generated by Doxygen
This variant of `starpu_data_register()` uses the BCSR (Blocked Compressed Sparse Row Representation) sparse matrix interface. Register the sparse matrix made of `nnz` non-zero blocks of elements of size `elemsize` stored in `nzval` and initializes `handle` to represent it. Blocks have size `r * c`. `nrow` is the number of rows (in terms of blocks), `colind` is an array of `nnz` elements, `colind[i]` is the block-column index for block `i` in `nzval`, `rowptr` is an array of `nrow+1` elements, `rowptr[i]` is the block-index (in `nzval`) of the first block of row `i`. By convention, `rowptr[nrow]` is the number of blocks, this allows an easier access of the matrix’s elements for the kernels. `firstentry` is the index of the first entry of the given arrays (usually 0 or 1).

Here an example of how to use the function.

```c
/* We use the following matrix:

+----------------+
| 0 1 0 0 |
| 2 3 0 0 |
| 4 5 8 9 |
| 6 7 10 11|
+----------------+

* nzval = [0, 1, 2, 3] ++ [4, 5, 6, 7] ++ [8, 9, 10, 11]
* colind = [0, 0, 1]
* rowptr = [0, 1, 3]
* r = c = 2 */

/* Size of the blocks */
int R = 2;
int C = 2;

int NRROWS = 2;
int NNZ_BLOCKS = 3; /* out of 4 */
int NZVAL_SIZE = (R*C*NNZ_BLOCKS);

int nzval[NZVAL_SIZE] =
    {0, 1, 2, 3, /* First block */
    4, 5, 6, 7, /* Second block */
    8, 9, 10, 11 /* Third block */};

uint32_t colind[NNZ_BLOCKS] =
    {0, /* block-column index for first block in nzval */
    0, /* block-column index for second block in nzval */
    1 /* block-column index for third block in nzval */};

uint32_t rowptr[NRROWS+1] =
    {0, /* block-index in nzval of the first block of the first row. */
    1, /* block-index in nzval of the first block of the second row. */
    NNZ_BLOCKS /* number of blocks, to allow an easier element’s access for the kernels */};

starpu_data_handle_t bcsr_handle;
starpu_bcsr_data_register(&bcsr_handle,
                       STARPU_MAIN_RAM,
                       NRROWS,
                       (uintptr_t) nzval,
                       colind,
                       rowptr,
                       0, /* firstentry */
                       R,
                       C,
                       sizeof(nzval[0]));
```

### 29.9.5.11 starpu_csr_data_register()

```c
void starpu_csr_data_register ( starpu_data_handle_t handle,
                                int home_node,
                                uint32_t nnz,
                                uint32_t nrow,
                                uintptr_t nzval,
                                ...) {
```
This variant of `starpu_data_register()` uses the CSR (Compressed Sparse Row Representation) sparse matrix interface. TODO

29.9.5.12 starpu_coo_data_register()

```c
void starpu_coo_data_register (  
    starpu_data_handle_t * handleptr,  
    int home_node,  
    uint32_t nx,  
    uint32_t ny,  
    uint32_t n_values,  
    uint32_t * columns,  
    uint32_t * rows,  
    uintptr_t values,  
    size_t elemsize  
)
```

Register the nx x ny 2D matrix given in the COO format, using the `columns`, `rows`, `values` arrays, which must have `n_values` elements of size `elemsize`. Initialize `handleptr`.

29.9.5.13 starpu_data_get_interface_on_node()

```c
void * starpu_data_get_interface_on_node (  
    starpu_data_handle_t handle,  
    unsigned memory_node  
)
```

Return the interface associated with `handle` on `memory_node`.

29.9.5.14 starpu_data_handle_to_pointer()

```c
void * starpu_data_handle_to_pointer (  
    starpu_data_handle_t handle,  
    unsigned node  
)
```

Return the pointer associated with `handle` on node `node` or `NULL` if handle’s interface does not support this operation or data for this `handle` is not allocated on that `node`.

29.9.5.15 starpu_data_pointer_is_inside()

```c
int starpu_data_pointer_is_inside (  
    starpu_data_handle_t handle,  
    unsigned node,  
    void * pointer  
)
```

Return whether the given pointer is within the data for `handle` on node `node` (1) or not (0). If the handle interface does not support this operation, and thus the result is unknown, -1 is returned.

29.9.5.16 starpu_data_get_local_ptr()

```c
void * starpu_data_get_local_ptr (  
    starpu_data_handle_t handle  
)
```

Return the local pointer associated with `handle` or `NULL` if handle’s interface does not have any data allocated locally.

29.9.5.17 starpu_data_get_interface_id()

```c
enum starpu_data_interface_id starpu_data_get_interface_id (  
    starpu_data_handle_t handle  
)
```

Return the unique identifier of the interface associated with the given `handle`. 
29.9.5.18 starpu_data_get_size()

size_t starpu_data_get_size (    
        starpu_data_handle_t handle )

Return the size of the data associated with handle.

29.9.5.19 starpu_data_pack()

int starpu_data_pack (    
        starpu_data_handle_t handle,    
        void **ptr,    
        starpu_ssize_t * count )

Execute the packing operation of the interface of the data registered at handle (see starpu_data_interface_ops). This packing operation must allocate a buffer large enough at ptr and copy into the newly allocated buffer the data associated to handle. count will be set to the size of the allocated buffer. If ptr is NULL, the function should not copy the data in the buffer but just set count to the size of the buffer which would have been allocated. The special value -1 indicates the size is yet unknown.

29.9.5.20 starpu_data_unpack()

int starpu_data_unpack {    
        starpu_data_handle_t handle,    
        void * ptr,    
        size_t count }    

Unpack in handle the data located at ptr of size count as described by the interface of the data. The interface registered at handle must define a unpacking operation (see starpu_data_interface_ops). The memory at the address ptr is freed after calling the data unpacking operation.

29.9.5.21 starpu_variable_get_elemsize()

size_t starpu_variable_get_elemsize (    
        starpu_data_handle_t handle )

Return the size of the variable designated by handle.

29.9.5.22 starpu_variable_get_local_ptr()

uintptr_t starpu_variable_get_local_ptr (    
        starpu_data_handle_t handle )

Return a pointer to the variable designated by handle.

29.9.5.23 starpu_vector_get_nx()

uint32_t starpu_vector_get_nx (    
        starpu_data_handle_t handle )

Return the number of elements registered into the array designated by handle.

29.9.5.24 starpu_vector_get elemsize()

size_t starpu_vector_get_elemsize (    
        starpu_data_handle_t handle )

Return the size of each element of the array designated by handle.

29.9.5.25 starpu_vector_get_local_ptr()

uintptr_t starpu_vector_get_local_ptr (    
        starpu_data_handle_t handle )

Return the local pointer associated with handle.
29.9.5.26  starpu_matrix_get_nx()

uint32_t starpu_matrix_get_nx (  
    starpu_data_handle_t handle  )

Return the number of elements on the x-axis of the matrix designated by handle.

29.9.5.27  starpu_matrix_get_ny()

uint32_t starpu_matrix_get_ny (  
    starpu_data_handle_t handle  )

Return the number of elements on the y-axis of the matrix designated by handle.

29.9.5.28  starpu_matrix_get_local_ld()

uint32_t starpu_matrix_get_local_ld (  
    starpu_data_handle_t handle  )

Return the number of elements between each row of the matrix designated by handle. Maybe be equal to nx when there is no padding.

29.9.5.29  starpu_matrix_get_local_ptr()

uintptr_t starpu_matrix_get_local_ptr (  
    starpu_data_handle_t handle  )

Return the local pointer associated with handle.

29.9.5.30  starpu_matrix_get_elemsize()

size_t starpu_matrix_get_elemsize (  
    starpu_data_handle_t handle  )

Return the size of the elements registered into the matrix designated by handle.

29.9.5.31  starpu_block_get_nx()

uint32_t starpu_block_get_nx (  
    starpu_data_handle_t handle  )

Return the number of elements on the x-axis of the block designated by handle.

29.9.5.32  starpu_block_get_ny()

uint32_t starpu_block_get_ny (  
    starpu_data_handle_t handle  )

Return the number of elements on the y-axis of the block designated by handle.

29.9.5.33  starpu_block_get_nz()

uint32_t starpu_block_get_nz (  
    starpu_data_handle_t handle  )

Return the number of elements on the z-axis of the block designated by handle.

29.9.5.34  starpu_block_get_local_ldy()

uint32_t starpu_block_get_local_ldy (  
    starpu_data_handle_t handle  )

Return the number of elements between each row of the block designated by handle, in the format of the current memory node.
29.9.5.35  starpu_block_get_local_ldz()

```
uint32_t starpu_block_get_local_ldz (  
   starpu_data_handle_t handle  )
```

Return the number of elements between each z plane of the block designated by `handle`, in the format of the current memory node.

29.9.5.36  starpu_block_get_local_ptr()

```
uintptr_t starpu_block_get_local_ptr (  
   starpu_data_handle_t handle  )
```

Return the local pointer associated with `handle`.

29.9.5.37  starpu_block_get_elemsize()

```
size_t starpu_block_get_elemsize (  
   starpu_data_handle_t handle  )
```

Return the size of the elements of the block designated by `handle`.

29.9.5.38  starpu_bcsr_get_nnz()

```
uint32_t starpu_bcsr_get_nnz (  
   starpu_data_handle_t handle  )
```

Return the number of non-zero elements in the matrix designated by `handle`.

29.9.5.39  starpu_bcsr_get_nrow()

```
uint32_t starpu_bcsr_get_nrow (  
   starpu_data_handle_t handle  )
```

Return the number of rows (in terms of blocks of size r×c) in the matrix designated by `handle`.

29.9.5.40  starpu_bcsr_get_firstentry()

```
uint32_t starpu_bcsr_get_firstentry (  
   starpu_data_handle_t handle  )
```

Return the index at which all arrays (the column indexes, the row pointers...) of the matrix designated by `handle`.

29.9.5.41  starpu_bcsr_get_local_nzval()

```
uintptr_t starpu_bcsr_get_local_nzval (  
   starpu_data_handle_t handle  )
```

Return a pointer to the non-zero values of the matrix designated by `handle`.

29.9.5.42  starpu_bcsr_get_local_colind()

```
uint32_t * starpu_bcsr_get_local_colind (  
   starpu_data_handle_t handle  )
```

Return a pointer to the column index, which holds the positions of the non-zero entries in the matrix designated by `handle`.

29.9.5.43  starpu_bcsr_get_local_rowptr()

```
uint32_t * starpu_bcsr_get_local_rowptr (  
   starpu_data_handle_t handle  )
```

Return the row pointer array of the matrix designated by `handle`. 
29.9.5.44 starpu_bcsr_get_r()

```c
uint32_t starpu_bcsr_get_r ( starpu_data_handle_t handle )
```

Return the number of rows in a block.

29.9.5.45 starpu_bcsr_get_c()

```c
uint32_t starpu_bcsr_get_c ( starpu_data_handle_t handle )
```

Return the number of columns in a block.

29.9.5.46 starpu_bcsr_get_elemsize()

```c
size_t starpu_bcsr_get_elemsize ( starpu_data_handle_t handle )
```

Return the size of the elements in the matrix designated by handle.

29.9.5.47 starpu_csr_get_nnz()

```c
uint32_t starpu_csr_get_nnz ( starpu_data_handle_t handle )
```

Return the number of non-zero values in the matrix designated by handle.

29.9.5.48 starpu_csr_get_nrow()

```c
uint32_t starpu_csr_get_nrow ( starpu_data_handle_t handle )
```

Return the size of the row pointer array of the matrix designated by handle.

29.9.5.49 starpu_csr_get_firstentry()

```c
uint32_t starpu_csr_get_firstentry ( starpu_data_handle_t handle )
```

Return the index at which all arrays (the column indexes, the row pointers...) of the matrix designated by handle.

29.9.5.50 starpu_csr_get_local_nzval()

```c
uintptr_t starpu_csr_get_local_nzval ( starpu_data_handle_t handle )
```

Return a local pointer to the non-zero values of the matrix designated by handle.

29.9.5.51 starpu_csr_get_local_colind()

```c
uint32_t * starpu_csr_get_local_colind ( starpu_data_handle_t handle )
```

Return a local pointer to the column index of the matrix designated by handle.

29.9.5.52 starpu_csr_get_local_rowptr()

```c
uint32_t * starpu_csr_get_local_rowptr ( starpu_data_handle_t handle )
```

Return a local pointer to the row pointer array of the matrix designated by handle.

29.9.5.53 starpu_csr_get_elemsize()

```c
size_t starpu_csr_get_elemsize ( starpu_data_handle_t handle )
```

Return the size of the elements registered into the matrix designated by handle.
29.9.5.54 starpu_malloc_on_node_flags()

uintptr_t starpu_malloc_on_node_flags (
    unsigned dst_node,
    size_t size,
    int flags )

Allocate size bytes on node dst_node with the given allocation flags. This returns 0 if allocation failed, the allocation method should then return -ENOMEM as allocated size. Deallocation must be done with starpu_free_on_node().

29.9.5.55 starpu_free_on_node_flags()

void starpu_free_on_node_flags (
    unsigned dst_node,
    uintptr_t addr,
    size_t size,
    int flags )

Free addr of size bytes on node dst_node which was previously allocated with starpu_malloc_on_node() with the given allocation flags.

29.9.5.56 starpu_malloc_on_node()

uintptr_t starpu_malloc_on_node (
    unsigned dst_node,
    size_t size )

Allocate size bytes on node dst_node with the default allocation flags. This returns 0 if allocation failed, the allocation method should then return -ENOMEM as allocated size. Deallocation must be done with starpu_free_on_node().

29.9.5.57 starpu_free_on_node()

void starpu_free_on_node (
    unsigned dst_node,
    uintptr_t addr,
    size_t size )

Free addr of size bytes on node dst_node which was previously allocated with starpu_malloc_on_node().

29.9.5.58 starpu_malloc_on_node_set_default_flags()

void starpu_malloc_on_node_set_default_flags (
    unsigned node,
    int flags )

Define the default flags for allocations performed by starpu_malloc_on_node() and starpu_free_on_node(). The default is STARPU_MALLOC_PINNED | STARPU_MALLOC_COUNT.

29.9.5.59 starpu_interface_copy()

int starpu_interface_copy ( 
    uintptr_t src,
    size_t src_offset,
    unsigned src_node,
    uintptr_t dst,
    size_t dst_offset,
    unsigned dst_node,
    size_t size,
    void * async_data )

Copy size bytes from byte offset src_offset of src on src_node to byte offset dst_offset of dst on dst_node. This is to be used in the starpu_data_copy_methods::any_to_any copy method, which is provided with async_data to be passed to starpu_interface_copy(). This returns -EAGAIN if the transfer is still ongoing, or 0 if the transfer is already completed.
29.9.5.60 starpu_interface_start_driver_copy_async()

```c
void starpu_interface_start_driver_copy_async (unsigned src_node, unsigned dst_node, double * start )
```

When an asynchronous implementation of the data transfer is implemented, the call to the underlying CUDA, OpenCL, etc. call should be surrounded by calls to `starpu_interface_start_driver_copy_async()` and `starpu_interface_end_driver_copy_async()`, so that it is recorded in offline execution traces, and the timing of the submission is checked. `start` must point to a variable whose value will be passed unchanged to `starpu_interface_end_driver_copy_async()`.

29.9.5.61 starpu_interface_end_driver_copy_async()

```c
void starpu_interface_end_driver_copy_async (unsigned src_node, unsigned dst_node, double start )
```

See `starpu_interface_start_driver_copy_async()`.

29.9.5.62 starpu_hash_crc32c_be_n()

```c
uint32_t starpu_hash_crc32c_be_n (const void * input, size_t n, uint32_t inputcrc )
```

Compute the CRC of a byte buffer seeded by the `inputcrc` current state. The return value should be considered as the new `current state` for future CRC computation. This is used for computing data size footprint.

29.9.5.63 starpu_hash_crc32c_be()

```c
uint32_t starpu_hash_crc32c_be (uint32_t input, uint32_t inputcrc )
```

Compute the CRC of a 32bit number seeded by the `inputcrc` current state. The return value should be considered as the new `current state` for future CRC computation. This is used for computing data size footprint.

29.9.5.64 starpu_hash_crc32c_string()

```c
uint32_t starpu_hash_crc32c_string (const char * str, uint32_t inputcrc )
```

Compute the CRC of a string seeded by the `inputcrc` current state. The return value should be considered as the new `current state` for future CRC computation. This is used for computing data size footprint.

29.9.5.65 starpu_data_interface_get_next_id()

```c
int starpu_data_interface_get_next_id (void )
```

Return the next available id for a newly created data interface (Defining A New Data Interface).

29.10 Data Partition

Data Structures

- struct starpu_data_filter
Basic API

- void starpu_data_partition (starpu_data_handle_t initial_handle, struct starpu_data_filter *f)
- void starpu_data_unpartition (starpu_data_handle_t root_data, unsigned gathering_node)
- int starpu_data_get_nb_children (starpu_data_handle_t handle)
- starpu_data_handle_t starpu_data_get_child (starpu_data_handle_t handle, unsigned i)
- starpu_data_handle_t starpu_data_get_sub_data (starpu_data_handle_t root_data, unsigned depth,...)
- starpu_data_handle_t starpu_data_vget_sub_data (starpu_data_handle_t root_data, unsigned depth, va_list pa)
- void starpu_data_map_filters (starpu_data_handle_t root_data, unsigned nfilters,...)
- void starpu_data_vmap_filters (starpu_data_handle_t root_data, unsigned nfilters, va_list pa)

Asynchronous API

- void starpu_data_partition_plan (starpu_data_handle_t initial_handle, struct starpu_data_filter *f, starpu_data_handle_t *children)
- void starpu_data_partition_submit (starpu_data_handle_t initial_handle, unsigned nparts, starpu_data_handle_t *children)
- void starpu_data_partition_readonly_submit (starpu_data_handle_t initial_handle, unsigned nparts, starpu_data_handle_t *children)

Predefined Matrix Filter Functions

This section gives a partial list of the predefined partitioning functions for matrix data. Examples on how to use them are shown in Partitioning Data. The complete list can be found in the file starpu_data_filters.h.

- void starpu_matrix_filter_block (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)
- void starpu_matrix_filter_block_shadow (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)
• void starpu_matrix_filter_vertical_block (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

• void starpu_matrix_filter_vertical_block_shadow (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

Predefined Block Filter Functions

This section gives a partial list of the predefined partitioning functions for block data. Examples on how to use them are shown in Partitioning Data. The complete list can be found in the file starpu_data_filters.h. A usage example is available in examples/filters/shadow3d.c

• void starpu_block_filter_block (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

• void starpu_block_filter_block_shadow (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

• void starpu_block_filter_vertical_block (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

• void starpu_block_filter_vertical_block_shadow (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

• void starpu_block_filter_depth_block (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

• void starpu_block_filter_depth_block_shadow (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

Predefined BCSR Filter Functions

This section gives a partial list of the predefined partitioning functions for BCSR data. Examples on how to use them are shown in Partitioning Data. The complete list can be found in the file starpu_data_filters.h.

• void starpu_bcsr_filter_canonical_block (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

• void starpu_csr_filter_vertical_block (void *father_interface, void *child_interface, struct starpu_data_filter *f, unsigned id, unsigned nparts)

29.10.1 Detailed Description

29.10.2 Data Structure Documentation

29.10.2.1 struct starpu_data_filter

The filter structure describes a data partitioning operation, to be given to the starpu_data_partition() function.

Data Fields

• void(* filter_func)(void *father_interface, void *child_interface, struct starpu_data_filter *, unsigned id, unsigned nparts)

• unsigned nchildren

• unsigned(* get_nchildren)(struct starpu_data_filter *, starpu_data_handle_t initial_handle)

• struct starpu_data_interface_ops *(* get_child_ops)(struct starpu_data_filter *, unsigned id)

• unsigned filter_arg

• void * filter_arg_ptr

29.10.2.1.1 Field Documentation
29.10.2.1.1 filter_func

```c
void(* starpu_data_filter::filter_func)(void *father_interface, void *child_interface, struct starpu_data_filter *filter, unsigned i, unsigned nparts)
```

Fill the child_interface structure with interface information for the i-th child of the parent father_interface (among nparts). The filter structure is provided, allowing to inspect the starpu_data_filter::*filter_arg and starpu_data_filter::*filter_arg_ptr parameters.

The details of what needs to be filled in child_interface vary according to the data interface, but generally speaking:

- `id` is usually just copied over from the father, when the sub data has the same structure as the father, e.g. a subvector is a vector, a submatrix is a matrix, etc. This is however not the case for instance when dividing a BCSR matrix into its dense blocks, which then are matrices.

- `nx, ny` and alike are usually divided by the number of subdata, depending how the subdivision is done (e.g. nx division vs ny division for vertical matrix division vs horizontal matrix division).

- `ld` for matrix interfaces are usually just copied over: the leading dimension (ld) usually does not change.

- `elemsize` is usually just copied over.

- `ptr`, the pointer to the data, has to be computed according to `i` and the father's `ptr`, so as to point to the start of the sub data. This should however be done only if the father has `ptr` different from NULL: in the OpenCL case notably, the `dev_handle` and `offset` fields are used instead.

- `dev_handle` should be just copied over from the parent.

- `offset` has to be computed according to `i` and the father's `offset`, so as to provide the offset of the start of the sub data. This is notably used for the OpenCL case.

29.10.2.1.2 nchildren

```c
unsigned starpu_data_filter::nchildren
```

Number of parts to partition the data into.

29.10.2.1.3 get_nchildren

```c
unsigned(* starpu_data_filter::get_nchildren)(struct starpu_data_filter *, starpu_data_handle_t initial_handle)
```

Return the number of children. This can be used instead of starpu_data_filter::nchildren when the number of children depends on the actual data (e.g. the number of blocks in a sparse matrix).

29.10.2.1.4 get_child_ops

```c
struct starpu_data_interface_ops *(* starpu_data_filter::get_child_ops)(struct starpu_data_filter *, unsigned id)
```

In case the resulting children use a different data interface, this function returns which interface is used by child number id.

29.10.2.1.5 filter_arg

```c
unsigned starpu_data_filter::filter_arg
```

Additional parameter for the filter function

29.10.2.1.6 filter_arg_ptr

```c
void * starpu_data_filter::filter_arg_ptr
```

Additional pointer parameter for the filter function, such as the sizes of the different parts.
29.10.3.1 starpu_data_partition()

void starpu_data_partition (  
    starpu_data_handle_t initial_handle,  
    struct starpu_data_filter * f  
)  
Request the partitioning of initial_handle into several subdata according to the filter f.
Here an example of how to use the function.

struct starpu_data_filter f =  
{  
    .filter_func = starpu_matrix_filter_block,  
    .nchildren = nslicesx  
};  
starpu_data_partition(A_handle, &f);  

29.10.3.2 starpu_data_unpartition()

void starpu_data_unpartition (  
    starpu_data_handle_t root_data,  
    unsigned gathering_node  
)  
Unapply the filter which has been applied to root_data, thus unpartitioning the data. The pieces of data are collected back into one big piece in the gathering_node (usually STARPU_MAIN_RAM). Tasks working on the partitioned data must be already finished when calling starpu_data_unpartition().
Here an example of how to use the function.

starpu_data_unpartition(A_handle, STARPU_MAIN_RAM);  

29.10.3.3 starpu_data_get_nb_children()

int starpu_data_get_nb_children (  
    starpu_data_handle_t handle  
)  
Return the number of children handle has been partitioned into.

29.10.3.4 starpu_data_get_child()

starpu_data_handle_t starpu_data_get_child (  
    starpu_data_handle_t handle,  
    unsigned i  
)  
Return the i-th child of the given handle, which must have been partitioned beforehand.

29.10.3.5 starpu_data_get_sub_data()

starpu_data_handle_t starpu_data_get_sub_data (  
    starpu_data_handle_t root_data,  
    unsigned depth,  
    ...  
)  
After partitioning a StarPU data by applying a filter, starpu_data_get_sub_data() can be used to get handles for each of the data portions. root_data is the parent data that was partitioned. depth is the number of filters to traverse (in case several filters have been applied, to e.g. partition in row blocks, and then in column blocks), and the subsequent parameters are the indexes. The function returns a handle to the subdata.
Here an example of how to use the function.

h = starpu_data_get_sub_data(A_handle, i, taskx);
29.10.3.6 starpu_data_vget_sub_data()

```c
starpu_data_handle_t starpu_data_vget_sub_data (
    starpu_data_handle_t root_data,
    unsigned depth,
    va_list pa )
```

This function is similar to `starpu_data_get_sub_data()` but uses a `va_list` for the parameter list.

29.10.3.7 starpu_data_map_filters()

```c
void starpu_data_map_filters ( 
    starpu_data_handle_t root_data,
    unsigned nfilters,
    ... )
```

Apply `nfilters` filters to the handle designated by `root_handle` recursively. `nfilters` pointers to variables of the type `starpu_data_filter` should be given.

29.10.3.8 starpu_data_vmap_filters()

```c
void starpu_data_vmap_filters ( 
    starpu_data_handle_t root_data,
    unsigned nfilters,
    va_list pa )
```

Apply `nfilters` filters to the handle designated by `root_handle` recursively. It uses a `va_list` of pointers to variables of the type `starpu_data_filter`.

29.10.3.9 starpu_data_partition_plan()

```c
void starpu_data_partition_plan ( 
    starpu_data_handle_t initial_handle,
    struct starpu_data_filter * f,
    starpu_data_handle_t * children )
```

Plan to partition `initial_handle` into several subdata according to the filter `f`. The handles are returned into the `children` array, which has to be the same size as the number of parts described in `f`. These handles are not immediately usable, `starpu_data_partition_submit()` has to be called to submit the actual partitioning.

Here is an example of how to use the function:

```c
starpu_data_handle_t children[nslicesx];
struct starpu_data_filter f =
{     .filter_func = starpu_matrix_filter_block,
     .nchildren = nslicesx
};
starpu_data_partition_plan(A_handle, &f, children);
```

29.10.3.10 starpu_data_partition_submit()

```c
void starpu_data_partition_submit ( 
    starpu_data_handle_t initial_handle,
    unsigned nparts,
    starpu_data_handle_t * children )
```

Submit the actual partitioning of `initial_handle` into the `nparts children` handles. This call is asynchronous, it only submits that the partitioning should be done, so that the `children` handles can now be used to submit tasks, and `initial_handle` can not be used to submit tasks any more (to guarantee coherency).

For instance,

```c
starpu_data_partition_submit(A_handle, nslicesx, children);
```
29.10.3.11 starpu_data_partition_readonly_submit()

```c
void starpu_data_partition_readonly_submit (  
    starpu_data_handle_t initial_handle,  
    unsigned nparts,  
    starpu_data_handle_t * children )
```

This is the same as `starpu_data_partition_submit()`, but it does not invalidate `initial_handle`. This allows to continue using it, but the application has to be careful not to write to `initial_handle` or `children` handles, only read from them, since the coherency is otherwise not guaranteed. This thus allows to submit various tasks which concurrently read from various partitions of the data.

When the application wants to write to `initial_handle` again, it should call `starpu_data_unpartition_submit()`, which will properly add dependencies between the reads on the `children` and the writes to be submitted.

If instead the application wants to write to `children` handles, it should call `starpu_data_partition_readwrite_upgrade_submit()`, which will correctly add dependencies between the reads on the `initial_handle` and the writes to be submitted.

29.10.3.12 starpu_data_partition_readwrite_upgrade_submit()

```c
void starpu_data_partition_readwrite_upgrade_submit (  
    starpu_data_handle_t initial_handle,  
    unsigned nparts,  
    starpu_data_handle_t * children )
```

This assumes that a partitioning of `initial_handle` has already been submitted in readonly mode through `starpu_data_partition_readonly_submit()`, and will upgrade that partitioning into read-write mode for the `children`, by invalidating `initial_handle`, and adding the necessary dependencies.

29.10.3.13 starpu_data_partition_submit_sequential_consistency()

```c
void starpu_data_partition_submit_sequential_consistency (  
    starpu_data_handle_t initial_handle,  
    unsigned nparts,  
    starpu_data_handle_t * children,  
    int sequential_consistency )
```

Similar to `starpu_data_partition_submit()` but also allows to specify the coherency to be used for the main data `initial_handle` through the parameter `sequential_consistency`.

29.10.3.14 starpu_data_unpartition_submit()

```c
void starpu_data_unpartition_submit (  
    starpu_data_handle_t initial_handle,  
    unsigned nparts,  
    starpu_data_handle_t * children,  
    int gathering_node )
```

This assumes that `initial_handle` is partitioned into `children`, and submits an unpartitioning of it, i.e. submitting a gathering of the pieces on the requested `gathering_node` memory node, and submitting an invalidation of the children.

`gathering_node` can be set to -1 to let the runtime decide which memory node should be used to gather the pieces.

This call is asynchronous, it only submits that the unpartitioning should be done, so that the `children` handles should not be used to submit tasks any more, and `initial_handle` can now be used again to submit tasks.

29.10.3.15 starpu_data_unpartition_readonly_submit()

```c
void starpu_data_unpartition_readonly_submit (  
    starpu_data_handle_t initial_handle,  
    unsigned nparts,  
    starpu_data_handle_t * children,  
    int gathering_node )
```
This assumes that `initial_handle` is partitioned into `children`, and submits just a readonly unpartitionning of it, i.e. submitting a gathering of the pieces on the requested `gathering_node` memory node. It does not invalidate the children. This brings `initial_handle` and `children` handles to the same state as obtained with `starpu_data_partition_readonly_submit()`. `gathering_node` can be set to -1 to let the runtime decide which memory node should be used to gather the pieces.

29.10.3.16 `starpu_data_unpartition_submit_sequential_consistency()`

```c
void starpu_data_unpartition_submit_sequential_consistency (
    starpu_data_handle_t initial_handle,
    unsigned nparts,
    starpu_data_handle_t *children,
    int gathering_node,
    int sequential_consistency
)
```

Similar to `starpu_data_unpartition_submit()` but also allows to specify the coherency to be used for the main data `initial_handle` through the parameter `sequential_consistency`.

29.10.3.17 `starpu_data_partition_clean()`

```c
void starpu_data_partition_clean (
    starpu_data_handle_t root_data,
    unsigned nparts,
    starpu_data_handle_t *children
)
```

This should be used to clear the partition planning established between `root_data` and `children` with `starpu←data_partition_plan()`. This will notably submit an unregister all the `children`, which can thus not be used any more afterwards.

29.10.3.18 `starpu_vector_filter_block()`

```c
void starpu_vector_filter_block (  
    void *father_interface,  
    void *child_interface,  
    struct starpu_data_filter *f,  
    unsigned id,  
    unsigned nparts  
)
```

Return in `child_interface` the `id`th element of the vector represented by `father_interface` once partitioned in `nparts` chunks of equal size.

29.10.3.19 `starpu_vector_filter_block_shadow()`

```c
void starpu_vector_filter_block_shadow (  
    void *father_interface,  
    void *child_interface,  
    struct starpu_data_filter *f,  
    unsigned id,  
    unsigned nparts  
)
```

Return in `child_interface` the `id`th element of the vector represented by `father_interface` once partitioned in `nparts` chunks of equal size with a shadow border `filter_arg_ptr`, thus getting a vector of size \((n-2*\text{shadow})/\text{nparts}+2*\text{shadow})\). The `filter_arg_ptr` field of `f` must be the shadow size casted into `void`.

**IMPORTANT:** This can only be used for read-only access, as no coherency is enforced for the shadowed parts. An usage example is available in `examples/filters/shadow.c`

29.10.3.20 `starpu_vector_filter_list_long()`

```c
void starpu_vector_filter_list_long (  
    void *father_interface,  
    void *child_interface,  
)
```
struct starpu_data_filter * f,
unsigned id,
unsigned nparts );

Return in child_interface the id th element of the vector represented by father_interface once partitioned into nparts chunks according to the filter_arg_ptr field of f. The filter_arg_ptr field must point to an array of nparts long elements, each of which specifies the number of elements in each chunk of the partition.

29.10.3.21 starpu_vector_filter_list()

void starpu_vector_filter_list ( 
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts );

Return in child_interface the id th element of the vector represented by father_interface once partitioned into nparts chunks according to the filter_arg_ptr field of f. The filter_arg_ptr field must point to an array of nparts uint32_t elements, each of which specifies the number of elements in each chunk of the partition.

29.10.3.22 starpu_vector_filter_divide_in_2()

void starpu_vector_filter_divide_in_2 ( 
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts );

Return in child_interface the id th element of the vector represented by father_interface once partitioned in 2 chunks of equal size, ignoring nparts. Thus, id must be 0 or 1.

29.10.3.23 starpu_matrix_filter_block()

void starpu_matrix_filter_block ( 
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts );

Partition a dense Matrix along the x dimension, thus getting (x/nparts,y) matrices. If nparts does not divide x, the last submatrix contains the remainder.

29.10.3.24 starpu_matrix_filter_block_shadow()

void starpu_matrix_filter_block_shadow ( 
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts );

Partition a dense Matrix along the x dimension, with a shadow border filter_arg_ptr, thus getting ((x-2*shadow)/nparts +2*shadow,y) matrices. If nparts does not divide x-2*shadow, the last submatrix contains the remainder.

IMPORTANT: This can only be used for read-only access, as no coherency is enforced for the shadowed parts. A usage example is available in examples/filters/shadow2d.c
29.10.3.25 starpu_matrix_filter_vertical_block()

```c
void starpu_matrix_filter_vertical_block(
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts)
```

Partition a dense Matrix along the y dimension, thus getting \((x, y/nparts)\) matrices. If \(nparts\) does not divide \(y\), the last submatrix contains the remainder.

29.10.3.26 starpu_matrix_filter_vertical_block_shadow()

```c
void starpu_matrix_filter_vertical_block_shadow(
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts)
```

Partition a dense Matrix along the y dimension, with a shadow border \(filter_arg_ptr\), thus getting \((x, (y-2*shadow)/nparts + 2*shadow)\) matrices. If \(nparts\) does not divide \(y-2*shadow\), the last submatrix contains the remainder.

**IMPORTANT**: This can only be used for read-only access, as no coherency is enforced for the shadowed parts. A usage example is available in examples/filters/shadow2d.c

29.10.3.27 starpu_block_filter_block()

```c
void starpu_block_filter_block(
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts)
```

Partition a block along the X dimension, thus getting \((x/nparts, y, z)\) 3D matrices. If \(nparts\) does not divide \(x\), the last submatrix contains the remainder.

29.10.3.28 starpu_block_filter_block_shadow()

```c
void starpu_block_filter_block_shadow(
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts)
```

Partition a block along the X dimension, with a shadow border \(filter_arg_ptr\), thus getting \(((x-2*shadow)/nparts + 2*shadow, y, z)\) blocks. If \(nparts\) does not divide \(x\), the last submatrix contains the remainder.

**IMPORTANT**: This can only be used for read-only access, as no coherency is enforced for the shadowed parts.

29.10.3.29 starpu_block_filter_vertical_block()

```c
void starpu_block_filter_vertical_block(
    void * father_interface,
    void * child_interface,
    struct starpu_data_filter * f,
    unsigned id,
    unsigned nparts)
```

Partition a block along the Y dimension, thus getting \((x, y/nparts, z)\) blocks. If \(nparts\) does not divide \(y\), the last submatrix contains the remainder.
29.10.30 starpu_block_filter_vertical_block_shadow()

```c
void starpu_block_filter_vertical_block_shadow (  
    void * father_interface,  
    void * child_interface,  
    struct starpu_data_filter * f,  
    unsigned id,  
    unsigned nparts )
```

Partition a block along the Y dimension, with a shadow border $filter\_arg\_ptr$, thus getting $(x,(y-2*\text{shadow})/nparts + 2*\text{shadow},z)$ 3D matrices. If $nparts$ does not divide $y$, the last submatrix contains the remainder.

**IMPORTANT**: This can only be used for read-only access, as no coherency is enforced for the shadowed parts.

29.10.31 starpu_block_filter_depth_block()

```c
void starpu_block_filter_depth_block (  
    void * father_interface,  
    void * child_interface,  
    struct starpu_data_filter * f,  
    unsigned id,  
    unsigned nparts )
```

Partition a block along the Z dimension, thus getting $(x,y,z/nparts)$ blocks. If $nparts$ does not divide $z$, the last submatrix contains the remainder.

29.10.32 starpu_block_filter_depth_block_shadow()

```c
void starpu_block_filter_depth_block_shadow (  
    void * father_interface,  
    void * child_interface,  
    struct starpu_data_filter * f,  
    unsigned id,  
    unsigned nparts )
```

Partition a block along the Z dimension, with a shadow border $filter\_arg\_ptr$, thus getting $(x,y,(z-2*\text{shadow})/nparts + 2*\text{shadow})$ blocks. If $nparts$ does not divide $z$, the last submatrix contains the remainder.

**IMPORTANT**: This can only be used for read-only access, as no coherency is enforced for the shadowed parts.

29.10.33 starpu_bcsr_filter_canonical_block()

```c
void starpu_bcsr_filter_canonical_block (  
    void * father_interface,  
    void * child_interface,  
    struct starpu_data_filter * f,  
    unsigned id,  
    unsigned nparts )
```

Partition a block-sparse matrix into dense matrices.

29.10.34 starpu_csr_filter_vertical_block()

```c
void starpu_csr_filter_vertical_block (  
    void * father_interface,  
    void * child_interface,  
    struct starpu_data_filter * f,  
    unsigned id,  
    unsigned nparts )
```

Partition a block-sparse matrix into vertical block-sparse matrices.

29.11.2.1.1 Field Documentation
29.11.2.1.1.1 plug

```c
void *(starpu_disk_ops::plug)(void *parameters, size_t size)
```

Connect a disk memory at location \texttt{parameters} with size \texttt{size}, and return a base as \texttt{void*}, which will be passed by StarPU to all other methods.

29.11.2.1.1.2 unplug

```c
void(*(starpu_disk_ops::unplug)(void *base)
```

Disconnect a disk memory \texttt{base}.

29.11.2.1.1.3 bandwidth

```c
int(*(starpu_disk_ops::bandwidth)(unsigned node)
```

Measure the bandwidth and the latency for the disk \texttt{node} and save it. Returns 1 if it could measure it.

29.11.2.1.1.4 alloc

```c
void *(starpu_disk_ops::alloc)(void *base, size_t size)
```

Create a new location for datas of size \texttt{size}. This returns an opaque object pointer.

29.11.2.1.1.5 free

```c
void(*(starpu_disk_ops::free)(void *base, void *obj, size_t size)
```

Free a data \texttt{obj} previously allocated with \texttt{alloc}.

29.11.2.1.1.6 open

```c
void(*(starpu_disk_ops::open)(void *base, void *pos, size_t size)
```

Open an existing location of datas, at a specific position \texttt{pos} dependent on the backend.

29.11.2.1.1.7 close

```c
void(*(starpu_disk_ops::close)(void *base, void *obj, size_t size)
```

Close, without deleting it, a location of datas \texttt{obj}.

29.11.2.1.1.8 read

```c
int(*(starpu_disk_ops::read)(void *base, void *obj, void *buf, off_t offset, size_t size)
```

Read \texttt{size} bytes of data from \texttt{obj} in \texttt{base}, at offset \texttt{offset}, and put into \texttt{buf}. Returns the actual number of read bytes.

29.11.2.1.1.9 write

```c
int(*(starpu_disk_ops::write)(void *base, void *obj, const void *buf, off_t offset, size_t size)
```

Write \texttt{size} bytes of data to \texttt{obj} in \texttt{base}, at offset \texttt{offset}, and put into \texttt{buf}. Returns 0 on success.

29.11.2.1.1.10 full_read

```c
int(*(starpu_disk_ops::full_read)(void *base, void *obj, void **ptr, size_t *size)
```

Read all data from \texttt{obj} of \texttt{base}, from offset 0. Returns it in an allocated buffer \texttt{ptr}, of size \texttt{size}.

29.11.2.1.1.11 full_write

```c
int(*(starpu_disk_ops::full_write)(void *base, void *obj, void **ptr, size_t *size)
```

Write data in \texttt{ptr} to \texttt{obj} of \texttt{base}, from offset 0, and truncate \texttt{obj} to \texttt{size}, so that a \texttt{full_read} will get it.

29.11.2.1.1.12 async_write

```c
void(*(starpu_disk_ops::async_write)(void *base, void *obj, const void *buf, off_t offset, size_t *size)
```

Asynchronously write \texttt{size} bytes of data to \texttt{obj} in \texttt{base}, at offset \texttt{offset}, from \texttt{buf}. Returns a \texttt{void*} pointer that StarPU will pass to \_request methods for testing for the completion.

29.11.2.1.1.13 async_read

```c
void(*(starpu_disk_ops::async_read)(void *base, void *obj, void *buf, off_t offset, size_t *size)
```

Asynchronously read \texttt{size} bytes of data from \texttt{obj} in \texttt{base}, at offset \texttt{offset}, and put into \texttt{buf}. Returns a \texttt{void*} pointer that StarPU will pass to \_request methods for testing for the completion.

29.11.2.1.1.14 async_full_read

```c
void(*(starpu_disk_ops::async_full_read)(void *base, void *obj, void **ptr, size_t *size)
```

Generated by Doxygen
Read all data from obj of base, from offset 0. Returns it in an allocated buffer ptr, of size size.

29.11.2.1.15 async_full_write

void *(starpu_disk_ops::async_full_write)(void *base, void *obj, void *ptr, size_t size)
Write data in ptr to obj of base, from offset 0, and truncate obj to size, so that a full_read will get it.

29.11.2.1.16 copy

void *(starpu_disk_ops::copy)(void *base_src, void *obj_src, off_t offset_src, void *base_dst, void *obj_dst, off_t offset_dst, size_t size)
Copy from offset offset_src of disk object obj_src in base_src to offset offset_dst of disk object obj_dst in base_dst. Returns a void* pointer that StarPU will pass to *_request methods for testing for the completion.

29.11.2.1.17 wait_request

void *(starpu_disk_ops::wait_request)(void *async_channel)
Wait for completion of request async_channel returned by a previous asynchronous read, write or copy.

29.11.2.1.18 test_request

void *(starpu_disk_ops::test_request)(void *async_channel)
Test for completion of request async_channel returned by a previous asynchronous read, write or copy. Returns 1 on completion, 0 otherwise.

29.11.2.1.19 free_request

void *(starpu_disk_ops::free_request)(void *async_channel)
Free the request allocated by a previous asynchronous read, write or copy.

29.11.3 Macro Definition Documentation

29.11.3.1 STARPU_DISK_SIZE_MIN

#define STARPU_DISK_SIZE_MIN
Minimum size of a registered disk. The size of a disk is the last parameter of the function starpu_disk_register().

29.11.4 Function Documentation

29.11.4.1 starpu_disk_register()

int starpu_disk_register (struct starpu_disk_ops * func, void * parameter, starpu_ssize_t size)
Register a disk memory node with a set of functions to manipulate datas. The plug member of func will be passed parameter, and return a base which will be passed to all func methods.
SUCCESS: return the disk node.
FAIL: return an error code.
size must be at least STARPU_DISK_SIZE_MIN bytes ! size being negative means infinite size.

29.11.4.2 starpu_disk_open()

void * starpu_disk_open (unsigned node, void * pos, size_t size)
Open an existing file memory in a disk node. size is the size of the file. pos is the specific position dependent on the backend, given to the open method of the disk operations. This returns an opaque object pointer.
29.11.4.3 starpu_disk_close()

```c
void starpu_disk_close ( 
    unsigned node, 
    void * obj, 
    size_t size )
```

Close an existing data opened with starpu_disk_open().

29.11.5 Variable Documentation

29.11.5.1 starpu_disk_swap_node

```c
starpu_disk_swap_node
```

This contains the node number of the disk swap, if set up through the STARPU_DISK_SWAP variable.

29.11.5.2 starpu_disk_stdio_ops

```c
starpu_disk_stdio_ops
```

This set uses the stdio library (fwrite, fread...) to read/write on disk.
**Warning:** It creates one file per allocation!
It doesn't support asynchronous transfers.

29.11.5.3 starpu_disk_unistd_ops

```c
starpu_disk_unistd_ops
```

This set uses the unistd library (write, read...) to read/write on disk.
**Warning:** It creates one file per allocation!

29.11.5.4 starpu_disk_unistd_o_direct_ops

```c
starpu_disk_unistd_o_direct_ops
```

This set uses the unistd library (write, read...) to read/write on disk with the O_DIRECT flag.
**Warning:** It creates one file per allocation!
Only available on Linux systems.

29.11.5.5 starpu_disk_leveldb_ops

```c
starpu_disk_leveldb_ops
```

This set uses the leveldb created by Google
More information at [https://code.google.com/p/leveldb/](https://code.google.com/p/leveldb/)
It doesn't support asynchronous transfers.

29.11.5.6 starpu_disk_hdf5_ops

```c
starpu_disk_hdf5_ops
```

This set uses the HDF5 library.
**It doesn't support multiple opening from different processes.**
You may only allow one process to write in the HDF5 file.
**If HDF5 library is not compiled with --thread-safe you can't open more than one HDF5 file at the same time.**

29.12.3 Macro Definition Documentation
29.12.3.1 STARPU_MULTIFORMAT_GET_CPU_PTR

#define STARPU_MULTIFORMAT_GET_CPU_PTR(
    interface )
Return the local pointer to the data with CPU format.

29.12.3.2 STARPU_MULTIFORMAT_GET_CUDA_PTR

#define STARPU_MULTIFORMAT_GET_CUDA_PTR(
    interface )
Return the local pointer to the data with CUDA format.

29.12.3.3 STARPU_MULTIFORMAT_GET_OPENCL_PTR

#define STARPU_MULTIFORMAT_GET_OPENCL_PTR(
    interface )
Return the local pointer to the data with OpenCL format.

29.12.3.4 STARPU_MULTIFORMAT_GET_MIC_PTR

#define STARPU_MULTIFORMAT_GET_MIC_PTR(
    interface )
Return the local pointer to the data with MIC format.

29.12.3.5 STARPU_MULTIFORMAT_GET_NX

#define STARPU_MULTIFORMAT_GET_NX(
    interface )
Return the number of elements in the data.

29.12.4 Function Documentation

29.12.4.1 starpu_multiformat_data_register()

void starpu_multiformat_data_register ( 
    starpu_data_handle_t * handle, 
    int home_node, 
    void * ptr, 
    uint32_t nobjects, 
    struct starpu_multiformat_data_interface_ops * format_ops )

Register a piece of data that can be represented in different ways, depending upon the processing unit that manipu-
lates it. It allows the programmer, for instance, to use an array of structures when working on a CPU, and a structure 
of arrays when working on a GPU. nobjects is the number of elements in the data. format_ops describes the 
format.

29.13 Codelet And Tasks

This section describes the interface to manipulate codelets and tasks.

29.13.1 Detailed Description

This section describes the interface to manipulate codelets and tasks.

29.13.2 Data Structure Documentation

29.13.2.1 struct starpu_codelet

The codelet structure describes a kernel that is possibly implemented on various targets. For compatibility, make sure to initialize the whole structure to zero, either by using explicit memset, or the function `starpu_codelet_init()`, or by letting the compiler implicitly do it in e.g. static storage case.

29.13.2.1.1 Field Documentation

29.13.2.1.1.1 where

uint32_t starpu_codelet::where

Optional field to indicate which types of processing units are able to execute the codelet. The different values STARPU_CPU, STARPU_CUDA, STARPU_OPENCL can be combined to specify on which types of processing units the codelet can be executed. STARPU_CPU|STARPU_CUDA for instance indicates that the codelet is implemented for both CPU cores and CUDA devices while STARPU_OPENCL indicates that it is only available on OpenCL devices. If the field is unset, its value will be automatically set based on the availability of the XXX_funcs fields defined below. It can also be set to STARPU_NOWHERE to specify that no computation has to be actually done.

29.13.2.1.1.2 can_execute

int(* starpu_codelet::can_execute)(unsigned workerid, struct starpu_task *task, unsigned nimpl)

Define a function which should return 1 if the worker designated by workerid can execute the nimpl-th implementation of task, 0 otherwise.

29.13.2.1.1.3 type

enum starpu_codelet_type starpu_codelet::type

Optional field to specify the type of the codelet. The default is STARPU_SEQ, i.e. usual sequential implementation. Other values (STARPU_SPMD or STARPU_FORKJOIN declare that a parallel implementation is also available. See Parallel Tasks for details.

29.13.2.1.1.4 max_parallelism

int starpu_codelet::max_parallelism

Optional field. If a parallel implementation is available, this denotes the maximum combined worker size that StarPU will use to execute parallel tasks for this codelet.

29.13.2.1.1.5 cpu_func

starpu_cpu_func_t starpu_codelet::cpu_func

Deprecated Optional field which has been made deprecated. One should use instead the field starpu_codelet::cpu_funcs.

29.13.2.1.1.6 cuda_func

starpu_cuda_func_t starpu_codelet::cuda_func

Deprecated Optional field which has been made deprecated. One should use instead the starpu_codelet::cuda_funcs field.
29.13.2.1.7 opencl_func

`starpu_opencl_func_t starpu_codelet::opencl_func`

Deprecated Optional field which has been made deprecated. One should use instead the `starpu_codelet::opencl_funcs` field.

29.13.2.1.8 cpu_funcs

`starpu_cpu_func_t starpu_codelet::cpu_funcs[STARPU_MAXIMPLEMENTATIONS]`

Optional array of function pointers to the CPU implementations of the codelet. The functions prototype must be:

```c
void cpu_func(void *buffers[], void *cl_arg)
```

The first argument being the array of data managed by the data management library, and the second argument is a pointer to the argument passed from the field `starpu_task::cl_arg`. If the field `starpu_codelet::where` is set, then the field `starpu_codelet::cpu_funcs` is ignored if STARPU_CPU does not appear in the field `starpu_codelet::where`, it must be non-NULL otherwise.

29.13.2.1.9 cuda_funcs

`starpu_cuda_func_t starpu_codelet::cuda_funcs[STARPU_MAXIMPLEMENTATIONS]`

Optional array of function pointers to the CUDA implementations of the codelet. The functions must be host-functions written in the CUDA runtime API. Their prototype must be:

```c
void cuda_func(void *buffers[], void *cl_arg)
```

If the field `starpu_codelet::where` is set, then the field `starpu_codelet::cuda_funcs` is ignored if STARPU_CUDA does not appear in the field `starpu_codelet::where`, it must be non-NULL otherwise.

29.13.2.1.10 cuda_flags

`char starpu_codelet::cuda_flags[STARPU_MAXIMPLEMENTATIONS]`

Optional array of flags for CUDA execution. They specify some semantic details about CUDA kernel execution, such as asynchronous execution.

29.13.2.1.11 opencl_funcs

`starpu_opencl_func_t starpu_codelet::opencl_funcs[STARPU_MAXIMPLEMENTATIONS]`

Optional array of function pointers to the OpenCL implementations of the codelet. The functions prototype must be:

```c
void opencl_func(void *buffers[], void *cl_arg)
```

If the field `starpu_codelet::where` field is set, then the field `starpu_codelet::opencl_funcs` is ignored if STARPU_OPENCL does not appear in the field `starpu_codelet::where`, it must be non-NULL otherwise.

29.13.2.1.12 opencl_flags

`char starpu_codelet::opencl_flags[STARPU_MAXIMPLEMENTATIONS]`

Optional array of flags for OpenCL execution. They specify some semantic details about OpenCL kernel execution, such as asynchronous execution.

29.13.2.1.13 mic_funcs

`starpu_mic_func_t starpu_codelet::mic_funcs[STARPU_MAXIMPLEMENTATIONS]`

Optional array of function pointers to a function which returns the MIC implementation of the codelet. The functions prototype must be:

```c
starpu_mic_kernel_t mic_func(struct starpu_codelet *cl, unsigned nimpl)
```

If the field `starpu_codelet::where` field is set, then the field `starpu_codelet::mic_funcs` is ignored if STARPU_MIC does not appear in the field `starpu_codelet::where`. It can be NULL if `starpu_codelet::cpu_funcs_name` is non-NULL, in which case StarPU will simply make a symbol lookup to get the implementation.

29.13.2.1.14 mpi_ms_funcs

`starpu_mpi_ms_func_t starpu_codelet::mpi_ms_funcs[STARPU_MAXIMPLEMENTATIONS]`

Optional array of function pointers to a function which returns the MPI Master Slave implementation of the codelet. The functions prototype must be:
starpu_mpi_ms_kernel_t mpi_ms_func(struct starpu_codelet *cl, unsigned nimpl)

If the field `starpu_codelet::where` is set, then the field `starpu_codelet::mpi_ms_funcs` is ignored if `STARPU_MPI_MS` does not appear in the field `starpu_codelet::where`. It can be `NULL` if `starpu_codelet::cpu_funcs_name` is non-NULL, in which case StarPU will simply make a symbol lookup to get the implementation.

29.13.2.1.1.15 scc_funcs

starpu_scc_func_t starpu_codelet::scc_funcs[STARPU_MAXIMPLEMENTATIONS]
Optional array of function pointers to a function which returns the SCC implementation of the codelet. The functions prototype must be:

starpu_scc_kernel_t scc_func(struct starpu_codelet *cl, unsigned nimpl)

If the field `starpu_codelet::where` is set, then the field `starpu_codelet::scc_funcs` is ignored if `STARPU_SCC` does not appear in the field `starpu_codelet::where`. It can be `NULL` if `starpu_codelet::cpu_funcs_name` is non-NULL, in which case StarPU will simply make a symbol lookup to get the implementation.

29.13.2.1.1.16 cpufuncs_name

cchar * starpu_codelet::cpufuncs_name[STARPU_MAXIMPLEMENTATIONS]
Optional array of strings which provide the name of the CPU functions referenced in the array `starpu_codelet::cpu_funcs`. This can be used when running on MIC devices or the SCC platform, for StarPU to simply look up the MIC function implementation through its name.

29.13.2.1.1.17 nbuffers

int starpu_codelet::nbuffers

Specify the number of arguments taken by the codelet. These arguments are managed by the DSM and are accessed from the void buffers[] array. The constant argument passed with the field `starpu_task::cl_arg` is not counted in this number. This value should not be above `STARPU_NMAXBUFS`. It may be set to `STARPU_VARIABLE_NBUFFERS` to specify that the number of buffers and their access modes will be set in `starpu_task::nbuffers` and `starpu_task::modes` or `starpu_task::dyn_modes`, which thus permits to define codelets with a varying number of data.

29.13.2.1.1.18 modes

enum starpu_data_access_mode starpu_codelet::modes[STARPU_NMAXBUFS]
Is an array of `starpu_data_access_mode`. It describes the required access modes to the data needed by the codelet (e.g. `STARPU_RW`). The number of entries in this array must be specified in the field `starpu_codelet::nbuffers`, and should not exceed `STARPU_NMAXBUFS`. If unsufficient, this value can be set with the configure option `--enable-maxbuffers`.

29.13.2.1.1.19 dyn_modes

enum starpu_data_access_mode * starpu_codelet::dyn_modes
Is an array of `starpu_data_access_mode`. It describes the required access modes to the data needed by the codelet (e.g. `STARPU_RW`). The number of entries in this array must be specified in the field `starpu_codelet::nbuffers`. This field should be used for codelets having a number of datas greater than `STARPU_NMAXBUFS` (see Setting Many Data Handles For a Task). When defining a codelet, one should either define this field or the field `starpu_codelet::modes` defined above.

29.13.2.1.1.20 specific_nodes

unsigned starpu_codelet::specific_nodes

Default value is 0. If this flag is set, StarPU will not systematically send all data to the memory node where the task will be executing, it will read the `starpu_codelet::nodes` or `starpu_codelet::dyn_nodes` array to determine, for each data, whether to send it on the memory node where the task will be executing (-1), or on a specific node (≠ -1).

29.13.2.1.1.21 nodes

int starpu_codelet::nodes[STARPU_NMAXBUFS]
Optional field. When `starpu_codelet::specific_nodes` is 1, this specifies the memory nodes where each data should be sent to for task execution. The number of entries in this array is `starpu_codelet::nbuffers`, and should not exceed `STARPU_NMAXBUFS`.

29.13.2.1.1.22 dyn_nodes

int * starpu_codelet::dyn_nodes
Optional field. When `starpu_codelet::specific_nodes` is 1, this specifies the memory nodes where each data should be sent to for task execution. The number of entries in this array is `starpu_codelet::nbuffers`. This field should be used for codelets having a number of datas greater than `STARPU_NMAXBUFS` (see Setting Many Data Handles For a Task). When defining a codelet, one should either define this field or the field `starpu_codelet::nodes` defined above.

29.13.2.1.1.23  model

```c
struct starpu_perfmodel * starpu_codelet::model
```

Optional pointer to the task duration performance model associated to this codelet. This optional field is ignored when set to `NULL` or when its field `starpu_perfmodel::symbol` is not set.

29.13.2.1.1.24  energy_model

```c
struct starpu_perfmodel * starpu_codelet::energy_model
```

Optional pointer to the task energy consumption performance model associated to this codelet. This optional field is ignored when set to `NULL` or when its field `starpu_perfmodel::symbol` is not set. In the case of parallel codelets, this has to account for all processing units involved in the parallel execution.

29.13.2.1.1.25  per_worker_stats

```c
unsigned long starpu_codelet::per_worker_stats[STARPU_NMAXWORKERS]
```

Optional array for statistics collected at runtime: this is filled by StarPU and should not be accessed directly, but for example by calling the function `starpu_codelet_display_stats()` (See `starpu_codelet_display_stats()` for details).

29.13.2.1.1.26  name

```c
const char * starpu_codelet::name
```

Optional name of the codelet. This can be useful for debugging purposes.

29.13.2.1.1.27  color

```c
unsigned starpu_codelet::color
```

Optional color of the codelet. This can be useful for debugging purposes.

29.13.2.1.1.28  flags

```c
const char * starpu_codelet::flags
```

Various flags for the codelet.

29.13.2.2  struct starpu_data_descr

This type is used to describe a data handle along with an access mode.

**Data Fields**

<table>
<thead>
<tr>
<th>starpu_data_handle_t</th>
<th>handle</th>
<th>describes a data</th>
</tr>
</thead>
<tbody>
<tr>
<td>enum starpu_data_access_mode</td>
<td>mode</td>
<td>describes its access mode</td>
</tr>
</tbody>
</table>

29.13.2.3  struct starpu_task

The structure describes a task that can be offloaded on the various processing units managed by StarPU. It instantiates a codelet. It can either be allocated dynamically with the function `starpu_task_create()`, or declared statically. In the latter case, the programmer has to zero the structure `starpu_task` and to fill the different fields properly. The indicated default values correspond to the configuration of a task allocated with `starpu_task_create()`.

**Data Fields**

- const char * name
- struct starpu_codelet * cl

• void * sched_data
29.13.2.3.1 Field Documentation

29.13.2.3.1.1 name
const char * starpu_task::name
Optional name of the task. This can be useful for debugging purposes.

29.13.2.3.1.2 cl
struct starpu_codelet * starpu_task::cl
Is a pointer to the corresponding structure starpu_codelet. This describes where the kernel should be executed, and supplies the appropriate implementations. When set to NULL, no code is executed during the tasks, such empty tasks can be useful for synchronization purposes. This field has been made deprecated. One should use instead the field starpu_task::handles to specify the data handles accessed by the task. The access modes are now defined in the field starpu_codelet::modes.

29.13.2.3.1.3 where
uint32_t starpu_task::where
When set, specifies where the task is allowed to be executed. When unset, it takes the value of starpu_codelet::where.

29.13.2.3.1.4 nbuffers
int starpu_task::nbuffers
Specifies the number of buffers. This is only used when starpu_codelet::nbuffers is STARPU_VARIABLE_NBUFFERS.

29.13.2.3.1.5 dyn_handles
starpu_data_handle_t * starpu_task::dyn_handles
Is an array of starpu_data_handle_t. It specifies the handles to the different pieces of data accessed by the task. The number of entries in this array must be specified in the field starpu_codelet::nbuffers. This field should be used for tasks having a number of datas greater than STARPU_NMAXBUFS (see Setting Many Data Handles For a Task). When defining a task, one should either define this field or the field starpu_task::handles defined above.

29.13.2.3.1.6 dyn_interfaces
void ** starpu_task::dynInterfaces
The actual data pointers to the memory node where execution will happen, managed by the DSM. Is used when the field starpu_task::dyn_handles is defined.

29.13.2.3.1.7 dyn_modes
enum starpu_data_access_mode * starpu_task::dyn_modes
Is used only when starpu_codelet::nbuffers is STARPU_VARIABLE_NBUFFERS. It is an array of starpu_data_access_mode. It describes the required access modes to the data needed by the codelet (e.g. STARPU_RW). The number of entries in this array must be specified in the field starpu_codelet::nbuffers. This field should be used for codelets having a number of datas greater than STARPU_NMAXBUFS (see Setting Many Data Handles For a Task). When defining a codelet, one should either define this field or the field starpu_task::modes defined above.

29.13.2.3.1.8 handles
starpu_data_handle_t starpu_task::handles[STARPU_NMAXBUFS]
Is an array of starpu_data_handle_t. It specifies the handles to the different pieces of data accessed by the task. The number of entries in this array must be specified in the field starpu_codelet::nbuffers, and should not exceed STARPU_NMAXBUFS. If unsufficient, this value can be set with the configure option --enable-maxbuffers.

29.13.2.3.1.9 interfaces
void * starpu_task::interfaces[STARPU_NMAXBUFS]
The actual data pointers to the memory node where execution will happen, managed by the DSM.

29.13.2.3.1.10 modes
enum starpu_data_access_mode starpu_task::modes[STARPU_NMAXBUFS]
Is used only when starpu_codelet::nbuffers is STARPU_VARIABLE_NBUFFERS. It is an array of starpu_data_access_mode. It describes the required access modes to the data needed by the codelet (e.g. STARPU_RW). The number of entries in this array must be specified in the field starpu_task::nbuffers, and should not exceed STARPU_NMAXBUFS.
29.13 Codelet And Tasks

STARPU_NMAXBUFS. If unsufficient, this value can be set with the configure option --enable-maxbuffers.

29.13.2.3.1.11 handles_sequential_consistency

char * starpu_task::handles_sequential_consistency
Optional pointer to an array of characters which allows to define the sequential consistency for each handle for the current task.

29.13.2.3.1.12 cl_arg

void * starpu_task::cl_arg
Optional pointer which is passed to the codelet through the second argument of the codelet implementation (e.g. starpu_codelet::cpu_func or starpu_codelet::cuda_func). The default value is NULL. starpu_codelet_pack_args() and starpu_codelet_unpack_args() are helpers that can be used to respectively pack and unpack data into and from it, but the application can manage it any way, the only requirement is that the size of the data must be set in starpu_task::cl_arg_size.

29.13.2.3.1.13 cl_arg_size

size_t starpu_task::cl_arg_size
Optional field. For some specific drivers, the pointer starpu_task::cl_arg cannot not be directly given to the driver function. A buffer of size starpu_task::cl_arg_size needs to be allocated on the driver. This buffer is then filled with the starpu_task::cl_arg_size bytes starting at address starpu_task::cl_arg. In this case, the argument given to the codelet is therefore not the starpu_task::cl_arg pointer, but the address of the buffer in local store (LS) instead. This field is ignored for CPU, CUDA and OpenCL codelets, where the starpu_task::cl_arg pointer is given as such.

29.13.2.3.1.14 callback_func

void(* starpu_task::callback_func)(void *)
Optional field, the default value is NULL. This is a function pointer of prototype void (*f)(void *) which specifies a possible callback. If this pointer is non-NULL, the callback function is executed on the host after the execution of the task. Tasks which depend on it might already be executing. The callback is passed the value contained in the starpu_task::callback_arg field. No callback is executed if the field is set to NULL.

29.13.2.3.1.15 callback_arg

void * starpu_task::callback_arg
Optional field, the default value is NULL. This is the pointer passed to the callback function. This field is ignored if the field starpu_task::callback_func is set to NULL.

29.13.2.3.1.16 prologue_callback_func

void(* starpu_task::prologue_callback_func)(void *)
Optional field, the default value is NULL. This is a function pointer of prototype void (*f)(void *) which specifies a possible callback. If this pointer is non-NULL, the callback function is executed on the host when the task becomes ready for execution, before getting scheduled. The callback is passed the value contained in the starpu_task::prologue_callback_arg field. No callback is executed if the field is set to NULL.

29.13.2.3.1.17 prologue_callback_arg

void * starpu_task::prologue_callback_arg
Optional field, the default value is NULL. This is the pointer passed to the prologue callback function. This field is ignored if the field starpu_task::prologue_callback_func is set to NULL.

29.13.2.3.1.18 prologue_callback_pop_func

void(* starpu_task::prologue_callback_pop_func)(void *)
todo

29.13.2.3.1.19 prologue_callback_pop_arg

void * starpu_task::prologue_callback_pop_arg
todo

29.13.2.3.1.20 tag_id

starpu_tag_t starpu_task::tag_id
This optional field contains the tag associated to the task if the field starpu_task::use_tag is set, it is ignored otherwise.
29.13.2.3.1.21  cl_arg_free

unsigned starpu_task::cl_arg_free

Optional field. In case starpu_task::cl_arg was allocated by the application through malloc(), setting starpu_task::cl_arg_free to 1 makes StarPU automatically call free(cl_arg) when destroying the task. This saves the user from defining a callback just for that. This is mostly useful when targeting MIC or SCC, where the codelet does not execute in the same memory space as the main thread.

29.13.2.3.1.22  callback_arg_free

unsigned starpu_task::callback_arg_free

Optional field. In case starpu_task::callback_arg was allocated by the application through malloc(), setting starpu_task::callback_arg_free to 1 makes StarPU automatically call free(callback_arg) when destroying the task.

29.13.2.3.1.23  prologue_callback_arg_free

unsigned starpu_task::prologue_callback_arg_free

Optional field. In case starpu_task::prologue_callback_arg was allocated by the application through malloc(), setting starpu_task::prologue_callback_arg_free to 1 makes StarPU automatically call free(prologue_callback_arg) when destroying the task.

29.13.2.3.1.24  prologue_callback_pop_arg_free

todo

29.13.2.3.1.25  use_tag

unsigned starpu_task::use_tag

Optional field, the default value is 0. If set, this flag indicates that the task should be associated with the tag contained in the starpu_task::tag_id field. Tag allow the application to synchronize with the task and to express task dependencies easily.

29.13.2.3.1.26  sequential_consistency

unsigned starpu_task::sequential_consistency

If this flag is set (which is the default), sequential consistency is enforced for the data parameters of this task for which sequential consistency is enabled. Clearing this flag permits to disable sequential consistency for this task, even if data have it enabled.

29.13.2.3.1.27  synchronous

unsigned starpu_task::synchronous

If this flag is set, the function starpu_task_submit() is blocking and returns only when the task has been executed (or if no worker is able to process the task). Otherwise, starpu_task_submit() returns immediately.

29.13.2.3.1.28  execute_on_a_specific_worker

unsigned starpu_task::execute_on_a_specific_worker

Default value is 0. If this flag is set, StarPU will bypass the scheduler and directly affect this task to the worker specified by the field starpu_task::workerid.

29.13.2.3.1.29  detach

unsigned starpu_task::detach

Optional field, default value is 1. If this flag is set, it is not possible to synchronize with the task by the means of starpu_task_wait() later on. Internal data structures are only guaranteed to be freed once starpu_task_wait() is called if the flag is not set.

29.13.2.3.1.30  destroy

unsigned starpu_task::destroy

Optional value. Default value is 0 for starpu_task_init(), and 1 for starpu_task_create(). If this flag is set, the task structure will automatically be freed, either after the execution of the callback if the task is detached, or during starpu_task_wait() otherwise. If this flag is not set, dynamically allocated data structures will not be freed until starpu_task_destroy() is called explicitly. Setting this flag for a statically allocated task structure will result in undefined behaviour. The flag is set to 1 when the task is created by calling starpu_task_create(). Note that starpu_task_wait_for_all() will not free any task.
29.13 Codelet And Tasks

29.13.2.3.1.31 regenerate

unsigned starpu_task::regenerate

Optional field. If this flag is set, the task will be re-submitted to StarPU once it has been executed. This flag must
not be set if the flag starpu_task::destroy is set. This flag must be set before making another task depend on this
one.

29.13.2.3.1.32 mf_skip

unsigned int starpu_task::mf_skip

This is only used for tasks that use multiformat handle. This should only be used by StarPU.

29.13.2.3.1.33 scheduled

unsigned starpu_task::scheduled

Whether the scheduler has pushed the task on some queue

29.13.2.3.1.34 prefetched

unsigned starpu_task::prefetched

todo

29.13.2.3.1.35 workerid

unsigned starpu_task::workerid

Optional field. If the field starpu_task::execute_on_a_specific_worker is set, this field indicates the identifier of
the worker that should process this task (as returned by starpu_worker_get_id()). This field is ignored if the field
starpu_task::execute_on_a_specific_worker is set to 0.

29.13.2.3.1.36 workerorder

unsigned starpu_task::workerorder

Optional field. If the field starpu_task::execute_on_a_specific_worker is set, this field indicates the per-worker
consecutive order in which tasks should be executed on the worker. Tasks will be executed in consecutive starpu__
task::workerorder values, thus ignoring the availability order or task priority. See Static Scheduling for more details.
This field is ignored if the field starpu_task::execute_on_a_specific_worker is set to 0.

29.13.2.3.1.37 workerids

unsigned starpu_task::workerids

Optional field. If the field starpu_task::workerids_len is different from 0, this field indicates an array of bits (stored
as uint32_t values) which indicate the set of workers which are allowed to execute the task. starpu_task::workerid
takes precedence over this.

29.13.2.3.1.38 workerids_len

unsigned starpu_task::workerids_len

Optional field. This provides the number of uint32_t values in the starpu_task::workerids array.

29.13.2.3.1.39 priority

int starpu_task::priority

Optional field, the default value is STARPU_DEFAULT_PRIO. This field indicates a level of priority for the task.
This is an integer value that must be set between the return values of the function starpu_sched_get_min_priority() for
the least important tasks, and that of the function starpu_sched_get_max_priority() for the most important tasks
(included). The STARPU_MIN_PRIO and STARPU_MAX_PRIO macros are provided for convenience and respec-
tively returns the value of starpu_sched_get_min_priority() and starpu_sched_get_max_priority(). Default priority
is STARPU_DEFAULT_PRIO, which is always defined as 0 in order to allow static task initialization. Schedul-
ing strategies that take priorities into account can use this parameter to take better scheduling decisions, but the
scheduling policy may also ignore it.

29.13.2.3.1.40 status

enum starpu_task_status starpu_task::status

Optional field. Current state of the task.

29.13.2.3.1.41 magic

int starpu_task::magic

This field is set when initializing a task. The function starpu_task_submit() will fail if the field does not have the right
value. This will hence avoid submitting tasks which have not been properly initialised.

Generated by Doxygen
Module Documentation a.k.a StarPU's API

29.13.2.3.1.42 type

unsigned starpu_task::type
This field allows to specify the type of task, for filtering out tasks in profiling outputs, whether it is really internal to StarPU (::STARPU_TASK_TYPE_INTERNAL), a data acquisition synchronization task (::STARPU_TASK_TYPE_E_DATA_ACQUIRE), or a normal task (::STARPU_TASK_TYPE_NORMAL)

29.13.2.3.1.43 color

int starpu_task::color
This field allows to specify the color of the task to be used in dag.dot.

29.13.2.3.1.44 sched_ctx

unsigned starpu_task::sched_ctx
Scheduling context.

29.13.2.3.1.45 hypervisor_tag

int starpu_task::hypervisor_tag
Helps the hypervisor monitor the execution of this task.

29.13.2.3.1.46 possibly_parallel

unsigned starpu_task::possibly_parallel
todo

29.13.2.3.1.47 bundle

starpu_task_bundle_t starpu_task::bundle
Optional field. The bundle that includes this task. If no bundle is used, this should be NULL.

29.13.2.3.1.48 profiling_info

struct starpu_profiling_task_info * starpu_task::profiling_info
Optional field. Profiling information for the task.

29.13.2.3.1.49 flops

double starpu_task::flops
This can be set to the number of floating points operations that the task will have to achieve. This is useful for easily getting GFlops curves from the tool starpu_perfmodel_plot, and for the hypervisor load balancing.

29.13.2.3.1.50 predicted

double starpu_task::predicted
Output field. Predicted duration of the task. This field is only set if the scheduling strategy uses performance models.

29.13.2.3.1.51 predicted_transfer

double starpu_task::predicted_transfer
Optional field. Predicted data transfer duration for the task in microseconds. This field is only valid if the scheduling strategy uses performance models.

29.13.2.3.1.52 predicted_start
double starpu_task::predicted_start
todo

29.13.2.3.1.53 prev

struct starpu_task * starpu_task::prev
A pointer to the previous task. This should only be used by StarPU.

29.13.2.3.1.54 next

struct starpu_task * starpu_task::next
A pointer to the next task. This should only be used by StarPU.

29.13.2.3.1.55 starpu_private

void * starpu_task::starpu_private
This is private to StarPU, do not modify. If the task is allocated by hand (without starpu_task_create()), this field should be set to NULL.
29.13 Codelet And Tasks

29.13.2.3.1.56 omp_task
struct starpu_omp_task * starpu_task::omp_task
todo

29.13.2.3.1.57 sched_data
struct starpu_omp_task * starpu_task::sched_data
This field is managed by the scheduler, is it allowed to do whatever with it. Typically, some area would be allocated
on push, and released on pop.

29.13.3 Macro Definition Documentation

29.13.3.1 STARPU_NOWHERE
#define STARPU_NOWHERE
This macro is used when setting the field starpu_codelet::where to specify that the codelet has no computation part,
and thus does not need to be scheduled, and data does not need to be actually loaded. This is thus essentially
used for synchronization tasks.

29.13.3.2 STARPU_CPU
#define STARPU_CPU
This macro is used when setting the field starpu_codelet::where (or starpu_task::where) to specify the codelet (or
the task) may be executed on a CPU processing unit.

29.13.3.3 STARPU_CUDA
#define STARPU_CUDA
This macro is used when setting the field starpu_codelet::where (or starpu_task::where) to specify the codelet (or
the task) may be executed on a CUDA processing unit.

29.13.3.4 STARPU_OPENCL
#define STARPU_OPENCL
This macro is used when setting the field starpu_codelet::where (or starpu_task::where) to specify the codelet (or
the task) may be executed on a OpenCL processing unit.

29.13.3.5 STARPU_MIC
#define STARPU_MIC
This macro is used when setting the field starpu_codelet::where (or starpu_task::where) to specify the codelet (or
the task) may be executed on a MIC processing unit.

29.13.3.6 STARPU_MPI_MS
#define STARPU_MPI_MS
This macro is used when setting the field starpu_codelet::where (or starpu_task::where) to specify the codelet (or
the task) may be executed on a MPI Slave processing unit.

29.13.3.7 STARPU_SCC
#define STARPU_SCC
This macro is used when setting the field starpu_codelet::where (or starpu_task::where) to specify the codelet (or
the task) may be executed on an SCC processing unit.

29.13.3.8 STARPU_MAIN_RAM
#define STARPU_MAIN_RAM
This macro is used when the RAM memory node is specified.
29.13.3.9  \texttt{STARPU\_MULTIPLE\_CPU\_IMPLEMENTATIONS}

\texttt{#define STARPU\_MULTIPLE\_CPU\_IMPLEMENTATIONS}

\textbf{Deprecated} Setting the field \texttt{starpu\_codelet::cpu\_func} with this macro indicates the codelet will have several implementations. The use of this macro is deprecated. One should always only define the field \texttt{starpu\_codelet::cpu\_funcs}.

29.13.3.10  \texttt{STARPU\_MULTIPLE\_CUDA\_IMPLEMENTATIONS}

\texttt{#define STARPU\_MULTIPLE\_CUDA\_IMPLEMENTATIONS}

\textbf{Deprecated} Setting the field \texttt{starpu\_codelet::cuda\_func} with this macro indicates the codelet will have several implementations. The use of this macro is deprecated. One should always only define the field \texttt{starpu\_codelet::cuda\_funcs}.

29.13.3.11  \texttt{STARPU\_MULTIPLE\_OPENCL\_IMPLEMENTATIONS}

\texttt{#define STARPU\_MULTIPLE\_OPENCL\_IMPLEMENTATIONS}

\textbf{Deprecated} Setting the field \texttt{starpu\_codelet::opencl\_func} with this macro indicates the codelet will have several implementations. The use of this macro is deprecated. One should always only define the field \texttt{starpu\_codelet::opencl\_funcs}.

29.13.3.12  \texttt{STARPU\_NMAXBUFS}

\texttt{#define STARPU\_NMAXBUFS}

Defines the maximum number of buffers that tasks will be able to take as parameters. The default value is 8, it can be changed by using the configure option \texttt{--enable-maxbuffers}.

29.13.3.13  \texttt{STARPU\_VARIABLE\_NUBUFFERS}

\texttt{#define STARPU\_VARIABLE\_NUBUFFERS}

Value to set in \texttt{starpu\_codelet::nbuffers} to specify that the codelet can accept a variable number of buffers, specified in \texttt{starpu\_task::nbuffers}.

29.13.3.14  \texttt{STARPU\_CUDA\_ASYNC}

\texttt{#define STARPU\_CUDA\_ASYNC}

Value to be set in \texttt{starpu\_codelet::cuda\_flags} to allow asynchronous CUDA kernel execution.

29.13.3.15  \texttt{STARPU\_OPENCL\_ASYNC}

\texttt{#define STARPU\_OPENCL\_ASYNC}

Value to be set in \texttt{starpu\_codelet::opencl\_flags} to allow asynchronous OpenCL kernel execution.

29.13.3.16  \texttt{STARPU\_CODELET\_SIMGRID\_EXECUTE}

\texttt{#define STARPU\_CODELET\_SIMGRID\_EXECUTE}

Value to be set in \texttt{starpu\_codelet::flags} to execute the codelet functions even in simgrid mode.

29.13.3.17  \texttt{STARPU\_CODELET\_SIMGRID\_EXECUTE\_AND\_INJECT}

\texttt{#define STARPU\_CODELET\_SIMGRID\_EXECUTE\_AND\_INJECT}

Value to be set in \texttt{starpu\_codelet::flags} to execute the codelet functions even in simgrid mode, and later inject the measured timing inside the simulation.
29.13.3.18  STARPU_CODELET_NOPLANS

#define STARPU_CODELET_NOPLANS
Value to be set in starpu_codelet::flags to make starpu_task_submit not submit automatic asynchronous partition-
ing/unpartitioning.

29.13.3.19  STARPU_TASK_INITIALIZER

#define STARPU_TASK_INITIALIZER
It is possible to initialize statically allocated tasks with this value. This is equivalent to initializing a structure starpu←
task with the function starpu_task_init().

29.13.3.20  STARPU_TASK_GET_NBUFFERS

#define STARPU_TASK_GET_NBUFFERS(
   task
)
Return the number of buffers for task, i.e. starpu_codelet::nbuffers, or starpu_task::nbuffers if the former is ST←ARPU_VARIABLE_NBUFFERS.

29.13.3.21  STARPU_TASK_GET_HANDLE

#define STARPU_TASK_GET_HANDLE(
   task,
   i
)
Return the i-th data handle of task. If task is defined with a static or dynamic number of handles, will either return the i-th element of the field starpu_task::handles or the i-th element of the field starpu_task::dyn_handles (see Setting Many Data Handles For a Task)

29.13.3.22  STARPU_TASK_SET_HANDLE

#define STARPU_TASK_SET_HANDLE(
   task,
   handle,
   i
)
Set the i-th data handle of task with handle. If task is defined with a static or dynamic number of handles, will either set the i-th element of the field starpu_task::handles or the i-th element of the field starpu_task::dyn_handles (see Setting Many Data Handles For a Task)

29.13.3.23  STARPU_CODELET_GET_MODE

#define STARPU_CODELET_GET_MODE(
   codelet,
   i
)
Return the access mode of the i-th data handle of codelet. If codelet is defined with a static or dynamic number of handles, will either return the i-th element of the field starpu_codelet::modes or the i-th element of the field starpu_codelet::dyn_modes (see Setting Many Data Handles For a Task)

29.13.3.24  STARPU_CODELET_SET_MODE

#define STARPU_CODELET_SET_MODE(
   codelet,
   mode,
   i
)
Set the access mode of the i-th data handle of codelet. If codelet is defined with a static or dynamic number of handles, will either set the i-th element of the field starpu_codelet::modes or the i-th element of the field starpu_codelet::dyn_modes (see Setting Many Data Handles For a Task)
# Module Documentation a.k.a StarPU's API

## 29.13.3.25 STARPU_TASK_GET_MODE

```c
#define STARPU_TASK_GET_MODE(
    task,
    i)
```

Return the access mode of the `i`-th data handle of `task`. If `task` is defined with a static or dynamic number of handles, will either return the `i`-th element of the field `starpu_task::modes` or the `i`-th element of the field `starpu_task::dyn_modes` (see Setting Many Data Handles For a Task)

## 29.13.3.26 STARPU_TASK_SET_MODE

```c
#define STARPU_TASK_SET_MODE(
    task,
    mode,
    i)
```

Set the access mode of the `i`-th data handle of `task`. If `task` is defined with a static or dynamic number of handles, will either set the `i`-th element of the field `starpu_task::modes` or the `i`-th element of the field `starpu_task::dyn_modes` (see Setting Many Data Handles For a Task)

## 29.13.3.27 STARPU_CODELET_GET_NODE

```c
#define STARPU_CODELET_GET_NODE(
    codelet,
    i)
```

Return the target node of the `i`-th data handle of `codelet`. If `codelet` is defined with a static or dynamic number of handles, will either return the `i`-th element of the field `starpu_codelet::nodes` or the `i`-th element of the field `starpu_codelet::dyn_nodes` (see Setting Many Data Handles For a Task)

## 29.13.3.28 STARPU_CODELET_SET_NODE

```c
#define STARPU_CODELET_SET_NODE(
    codelet,
    __node,
    i)
```

Set the target node of the `i`-th data handle of `codelet`. If `codelet` is defined with a static or dynamic number of handles, will either set the `i`-th element of the field `starpu_codelet::nodes` or the `i`-th element of the field `starpu_codelet::dyn_nodes` (see Setting Many Data Handles For a Task)

## 29.13.4 Typedef Documentation

### 29.13.4.1 starpu_cpu_func_t

```c
tarpu_cpu_func_t
```

CPU implementation of a codelet.

### 29.13.4.2 starpu_cuda_func_t

```c
tarpu_cuda_func_t
```

CUDA implementation of a codelet.

### 29.13.4.3 starpu_opencl_func_t

```c
tarpu_opencl_func_t
```

OpenCL implementation of a codelet.
29.13 Codelet And Tasks

29.13.4 starpu_mic_func_t

starpu_mic_func_t
MIC implementation of a codelet.

29.13.5 starpu_mpi_ms_func_t

starpu_mpi_ms_func_t
MPI Master Slave implementation of a codelet.

29.13.6 starpu_scc_func_t

starpu_scc_func_t
SCC implementation of a codelet.

29.13.7 starpu_mic_kernel_t

starpu_mic_kernel_t
MIC kernel for a codelet

29.13.8 starpu_mpi_ms_kernel_t

starpu_mpi_ms_kernel_t
MPI Master Slave kernel for a codelet

29.13.9 starpu_scc_kernel_t

starpu_scc_kernel_t
SCC kernel for a codelet

29.13.5 Enumeration Type Documentation

29.13.5.1 starpu_codelet_type

enum starpu_codelet_type
Describes the type of parallel task. See Parallel Tasks for details.

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STARPU_SEQ</td>
<td>(default) for classical sequential tasks.</td>
</tr>
<tr>
<td>STARPU_SPMD</td>
<td>for a parallel task whose threads are handled by StarPU, the code has to use starpu_combined_worker_get_size() and starpu_combined_worker_get_rank() to distribute the work.</td>
</tr>
<tr>
<td>STARPU_FORKJOIN</td>
<td>for a parallel task whose threads are started by the codelet function, which has to use starpu_combined_worker_get_size() to determine how many threads should be started.</td>
</tr>
</tbody>
</table>

29.13.5.2 starpu_task_status

enum starpu_task_status
Task status

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STARPU_TASK_BLOCKED</td>
<td>The task has just been submitted, and its dependencies has not been checked yet.</td>
</tr>
</tbody>
</table>
29.13.6 Function Documentation

29.13.6.1 starpu_codelet_init()

```c
void starpu_codelet_init ( struct starpu_codelet * cl )
```

Initialize cl with default values. Codelets should preferably be initialized statically as shown in Defining A Codelet. However such a initialisation is not always possible, e.g. when using C++.

29.13.6.2 starpu_task_init()

```c
void starpu_task_init ( struct starpu_task * task )
```

Initialize task with default values. This function is implicitly called by starpu_task_create(). By default, tasks initialized with starpu_task_init() must be deinitialized explicitly with starpu_task_clean(). Tasks can also be initialized statically, using STARPU_TASK_INITIALIZER.

29.13.6.3 starpu_task_create()

```c
struct starpu_task * starpu_task_create ( )
```

Allocate a task structure and initialize it with default values. Tasks allocated dynamically with starpu_task_create() are automatically freed when the task is terminated. This means that the task pointer can not be used any more once the task is submitted, since it can be executed at any time (unless dependencies make it wait) and thus freed at any time. If the field starpu_task::destroy is explicitly unset, the resources used by the task have to be freed by calling starpu_task_destroy().

29.13.6.4 starpu_task_dup()

```c
struct starpu_task * starpu_task_dup ( struct starpu_task * task )
```

Allocate a task structure which is the exact duplicate of task.

29.13.6.5 starpu_task_clean()

```c
void starpu_task_clean ( struct starpu_task * task )
```

Release all the structures automatically allocated to execute task, but not the task structure itself and values set by the user remain unchanged. It is thus useful for statically allocated tasks for instance. It is also useful when users want to execute the same operation several times with as least overhead as possible. It is called automatically by starpu_task_destroy(). It has to be called only after explicitly waiting for the task or after starpu_shutdown() (waiting for the callback is not enough, since StarPU still manipulates the task after calling the callback).
29.13.6.6 starpu_task_destroy()

```c
void starpu_task_destroy ( struct starpu_task * task )
```

Free the resource allocated during starpu_task_create() and associated with task. This function is called automatically after the execution of a task when the field starpu_task::destroy is set, which is the default for tasks created by starpu_task_create(). Calling this function on a statically allocated task results in an undefined behaviour.

29.13.6.7 starpu_task_wait()

```c
int starpu_task_wait ( struct starpu_task * task )
```

Block until task has been executed. It is not possible to synchronize with a task more than once. It is not possible to wait for synchronous or detached tasks. Upon successful completion, this function returns 0. Otherwise, -EINVAL indicates that the specified task was either synchronous or detached.

29.13.6.8 starpu_task_wait_array()

```c
int starpu_task_wait_array ( struct starpu_task ** tasks, unsigned nb_tasks )
```

Allow to wait for an array of tasks. Upon successful completion, this function returns 0. Otherwise, -EINVAL indicates that one of the tasks was either synchronous or detached.

29.13.6.9 starpu_task_submit()

```c
int starpu_task_submit ( struct starpu_task * task )
```

Submit task to StarPU. Calling this function does not mean that the task will be executed immediately as there can be data or task (tag) dependencies that are not fulfilled yet: StarPU will take care of scheduling this task with respect to such dependencies. This function returns immediately if the field starpu_task::synchronous is set to 0, and block until the termination of the task otherwise. It is also possible to synchronize the application with asynchronous tasks by the means of tags, using the function starpu_tag_wait() function for instance. In case of success, this function returns 0, a return value of -ENODEV means that there is no worker able to process this task (e.g. there is no GPU available and this task is only implemented for CUDA devices). starpu_task_submit() can be called from anywhere, including codelet functions and callbacks, provided that the field starpu_task::synchronous is set to 0.

29.13.6.10 starpu_task_submit_to_ctx()

```c
int starpu_task_submit_to_ctx ( struct starpu_task * task, unsigned sched_ctx_id )
```

Submit task to the context sched_ctx_id. By default, starpu_task_submit() submits the task to a global context that is created automatically by StarPU.

29.13.6.11 starpu_task_wait_for_all()

```c
int starpu_task_wait_for_all ( void )
```

Block until all the tasks that were submitted (to the current context or the global one if there is no current context) are terminated. It does not destroy these tasks.

29.13.6.12 starpu_task_wait_for_all_in_ctx()

```c
int starpu_task_wait_for_all_in_ctx ( unsigned sched_ctx_id )
```

Wait until all the tasks that were already submitted to the context sched_ctx_id have been terminated.
29.13.6.13 starpu_task_wait_for_n_submitted()

int starpu_task_wait_for_n_submitted (  
  unsigned n )

Block until there are \( n \) submitted tasks left (to the current context or the global one if there is no current context) to be executed. It does not destroy these tasks.

29.13.6.14 starpu_task_wait_for_n_submitted_in_ctx()

int starpu_task_wait_for_n_submitted_in_ctx (  
  unsigned sched_ctx_id,  
  unsigned n )

Wait until there are \( n \) tasks submitted left to be executed that were already submitted to the context \( \text{sched_ctx} \leftarrow \_id \).

29.13.6.15 starpu_task_nready()

int starpu_task_nready (  
  void )

TODO
Return the number of submitted tasks which are ready for execution are already executing. It thus does not include tasks waiting for dependencies.

29.13.6.16 starpu_task_nsubmitted()

int starpu_task_nsubmitted (  
  void )

Return the number of submitted tasks which have not completed yet.

29.13.6.17 starpu_task_get_current()

struct starpu_task * starpu_task_get_current (  
  void )

Return the task currently executed by the worker, or NULL if it is called either from a thread that is not a task or simply because there is no task being executed at the moment.

29.13.6.18 starpu_task_get_current_data_node()

int starpu_task_get_current_data_node (  
  unsigned i )

Return the memory node number of parameter \( i \) of the task currently executed, or -1 if it is called either from a thread that is not a task or simply because there is no task being executed at the moment. Usually, the returned memory node number is simply the memory node for the current worker. That may however be different when using e.g. starpu_codelet::specific_nodes.

29.13.6.19 starpu_task_get_name()

const char * starpu_task_get_name (  
  struct starpu_task * task )

Return the name of \( \text{task} \), i.e. either its starpu_task::name field, or the name of the corresponding performance model.

29.13.6.20 starpu_task_get_model_name()

const char * starpu_task_get_model_name (  
  struct starpu_task * task )

Return the name of the performance model of \( \text{task} \).
29.13.6.21 starpu_codelet_display_stats()

```c
void starpu_codelet_display_stats (
    struct starpu_codelet ∗ cl )
```
Output on stderr some statistics on the codelet cl.

29.13.6.22 starpu_task_wait_for_no_ready()

```c
int starpu_task_wait_for_no_ready (  
    void )
```
Wait until there is no more ready task.

29.13.6.23 starpu_task_set_implementation()

```c
void starpu_task_set_implementation (  
    struct starpu_task ∗ task,  
    unsigned impl )
```
This function should be called by schedulers to specify the codelet implementation to be executed when executing task.

29.13.6.24 starpu_task_get_implementation()

```c
unsigned starpu_task_get_implementation (  
    struct starpu_task ∗ task )
```
Return the codelet implementation to be executed when executing task.

29.13.6.25 starpu_iteration_push()

```c
void starpu_iteration_push (  
    unsigned long iteration )
```
Sets the iteration number for all the tasks to be submitted after this call. This is typically called at the beginning of a task submission loop. This number will then show up in tracing tools. A corresponding starpu_iteration_pop() call must be made to match the call to starpu_iteration_push(), at the end of the same task submission loop, typically. Nested calls to starpu_iteration_push and starpu_iteration_pop are allowed, to describe a loop nest for instance, provided that they match properly.

29.13.6.26 starpu_iteration_pop()

```c
void starpu_iteration_pop (  
    void )
```
Drops the iteration number for submitted tasks. This must match a previous call to starpu_iteration_push(), and is typically called at the end of a task submission loop.

29.13.6.27 starpu_create_sync_task()

```c
void starpu_create_sync_task (  
    starpu_tag_t sync_tag,  
    unsigned ndeps,  
    starpu_tag_t ∗ deps,  
    void (∗ callback)(void ∗ callback_arg )
```
Create (and submit) an empty task that unlocks a tag once all its dependencies are fulfilled.

29.14.1 Detailed Description

29.14.2 Macro Definition Documentation

29.14.2.1 STARPU_VALUE

#define STARPU_VALUE
Used when calling starpu_task_insert(), must be followed by a pointer to a constant value and the size of the constant

29.14.2.2 STARPU_CL_ARGS

#define STARPU_CL_ARGS
Used when calling starpu_task_insert(), must be followed by a memory buffer containing the arguments to be given to the task, and by the size of the arguments. The memory buffer should be the result of a previous call to starpu_codelet_pack_args(), and will be freed (i.e. starpu_task::cl_arg_free will be set to 1)
29.14.2.3  **STARPU_CL_ARGS_NFREE**

```c
#define STARPU_CL_ARGS_NFREE
```

Used when calling `starpu_task_insert()`, similarly to `STARPU_CL_ARGS`, must be followed by a memory buffer containing the arguments to be given to the task, and by the size of the arguments. The memory buffer should be the result of a previous call to `starpu_codelet_pack_args()`, and will NOT be freed (i.e. `starpu_task::cl_arg_free` will be set to 0).

29.14.2.4  **STARPU_CALLBACK**

```c
#define STARPU_CALLBACK
```

Used when calling `starpu_task_insert()`, must be followed by a pointer to a callback function.

29.14.2.5  **STARPU_CALLBACK_WITH_ARG**

```c
#define STARPU_CALLBACK_WITH_ARG
```

Used when calling `starpu_task_insert()`, must be followed by two pointers: one to a callback function, and the other to be given as an argument to the callback function; this is equivalent to using both `STARPU_CALLBACK` and `STARPU_CALLBACK_WITH_ARG`.

29.14.2.6  **STARPU_CALLBACK_ARG**

```c
#define STARPU_CALLBACK_ARG
```

Used when calling `starpu_task_insert()`, must be followed by a pointer to be given as an argument to the callback function.

29.14.2.7  **STARPU_PRIORITY**

```c
#define STARPU_PRIORITY
```

Used when calling `starpu_task_insert()`, must be followed by a integer defining a priority level.

29.14.2.8  **STARPU_DATA_ARRAY**

```c
#define STARPU_DATA_ARRAY
```

TODO

29.14.2.9  **STARPU_DATA_MODE_ARRAY**

```c
#define STARPU_DATA_MODE_ARRAY
```

TODO

29.14.2.10  **STARPU_EXECUTE_ON_WORKER**

```c
#define STARPU_EXECUTE_ON_WORKER
```

Used when calling `starpu_task_insert()`, must be followed by an integer value specifying the worker on which to execute the task (as specified by `starpu_task::execute_on_a_specific_worker`)

29.14.2.11  **STARPU_WORKER_ORDER**

```c
#define STARPU_WORKER_ORDER
```

Used when calling `starpu_task_insert()`, must be followed by an integer value specifying the worker order in which to execute the tasks (as specified by `starpu_task::workerorder`)

29.14.2.12  **STARPU_TAG**

```c
#define STARPU_TAG
```

Used when calling `starpu_task_insert()`, must be followed by a tag.

---

Generated by Doxygen
29.14.2.13  STARPU_TAG_ONLY

#define STARPU_TAG_ONLY
Used when calling starpu_task_insert(), must be followed by a tag stored in starpu_task::tag_id. Leave starpu_task::use_tag as 0.

29.14.2.14  STARPU_NAME

#define STARPU_NAME
Used when calling starpu_task_insert(), must be followed by a char * stored in starpu_task::name.

29.14.2.15  STARPU_FLOPS

#define STARPU_FLOPS
Used when calling starpu_task_insert(), must be followed by an amount of floating point operations, as a double. Users **MUST** explicitly cast into double, otherwise parameter passing will not work.

29.14.2.16  STARPU_SCHED_CTX

#define STARPU_SCHED_CTX
Used when calling starpu_task_insert(), must be followed by the id of the scheduling context to which to submit the task to.

29.14.2.17  STARPU_TASK_DEPS_ARRAY

#define STARPU_TASK_DEPS_ARRAY
Used when calling starpu_task_insert(), must be followed by a number of tasks, and an array containing these tasks. The function starpu_task_declare_deps_array() will be called with the given values.

29.14.2.18  STARPU_TASK_COLOR

#define STARPU_TASK_COLOR
Used when calling starpu_task_insert(), must be followed by an integer representing a color

29.14.2.19  STARPU_TASK_SYNCHRONOUS

#define STARPU_TASK_SYNCHRONOUS
Used when calling starpu_task_insert(), must be followed by an integer stating if the task is synchronous or not

29.14.2.20  STARPU_HANDLES_SEQUENTIAL_CONSISTENCY

#define STARPU_HANDLES_SEQUENTIAL_CONSISTENCY
Used when calling starpu_task_insert(), must be followed by an array of characters representing the sequential consistency for each buffer of the task.

29.14.3  Function Documentation

29.14.3.1  starpu_insert_task()

int starpu_insert_task {  
    struct starpu_codelet * cl,  
    ...  
}  
Similar to starpu_task_insert(). Kept to avoid breaking old codes.
29.14.3.2 starpu_task_insert()

```c
int starpu_task_insert (  
    struct starpu_codelet * cl,  
    ...  )
```

Create and submit a task corresponding to `cl` with the following given arguments. The argument list must be zero-terminated.

The arguments following the codelet can be of the following types:

- **STARPU_R, STARPU_W, STARPU_RW, STARPU_SCRATCH, STARPU_REDUX** an access mode followed by a data handle;

- **STARPU_DATA_ARRAY** followed by an array of data handles and its number of elements;

- **STARPU_DATA_MODE_ARRAY** followed by an array of struct `starpu_data_descr`, i.e data handles with their associated access modes, and its number of elements;

- **STARPU_EXECUTE_ON_WORKER, STARPU_WORKER_ORDER** followed by an integer value specifying the worker on which to execute the task (as specified by `starpu_task::execute_on_a_specific_worker`);

- the specific values **STARPU_VALUE, STARPU_CALLBACK, STARPU_CALLBACK_ARG, STARPU_CALLBACK_WITH_ARG, STARPU_PRIORITY, STARPU_TAG, STARPU_TAG_ONLY, STARPU_FLOPS, STARPU_SCHED_CTX, STARPU_CL_ARGS, STARPU_CL_ARGS_NFREE, STARPU_TASK_DEPENDS_ARRAY, STARPU_TASK_COLOR, STARPU_HANDLES_SEQUENTIALCONSISTENCY, STARPU_TASK_SYNCHRONOUS** followed by the appropriated objects as defined elsewhere.

When using **STARPU_DATA_ARRAY**, the access mode of the data handles is not defined, it will be taken from the codelet `starpu_codelet::modes` or `starpu_codelet::dyn_modes` field. One should use **STARPU_DATA_MODE_ARRAY** to define the data handles along with the access modes.

Parameters to be passed to the codelet implementation are defined through the type **STARPU_VALUE**. The function `starpu_codelet::unpack_args()` must be called within the codelet implementation to retrieve them.

29.14.3.3 starpu_task_insert_data_make_room()

```c
void starpu_task_insert_data_make_room (  
    struct starpu_codelet * cl,  
    struct starpu_task * task,  
    int * allocated_buffers,  
    int current_buffer,  
    int room )
```

Assuming that there are already current_buffer data handles passed to the task, and if `allocated_buffers` is not 0, the `task->dyn_handles` array has size `allocated_buffers`, this function makes room for `room` other data handles, allocating or reallocating `task->dyn_handles` as necessary and updating `allocated_buffers` accordingly. One can thus start with `allocated_buffers` equal to 0 and `current_buffer` equal to 0, then make room by calling this function, then store handles with `STARPU_TASK_SET_HANDLE()`, make room again with this function, store yet more handles, etc.

29.14.3.4 starpu_task_insert_data_process_arg()

```c
void starpu_task_insert_data_process_arg (  
    struct starpu_codelet * cl,  
    struct starpu_task * task,  
    int * allocated_buffers,  
    int current_buffer,  
    int arg_type,  
    starpu_data_handle_t handle )
```

Store data handle `handle` into task `task` with mode `arg_type`, updating `allocated_buffers` and `current_buffer` accordingly.
29.14.3.5 starpu_task_insert_data_process_array_arg()

```c
void starpu_task_insert_data_process_array_arg (
    struct starpu_codelet * cl,
    struct starpu_task * task,
    int * allocated_buffers,
    int * current_buffer,
    int nb_handles,
    starpu_data_handle_t * handles)
```

Store nb_handles data handles handles into task task, updating allocated_buffers and *current_buffer accordingly.

29.14.3.6 starpu_task_insert_data_process_mode_array_arg()

```c
void starpu_task_insert_data_process_mode_array_arg (
    struct starpu_codelet * cl,
    struct starpu_task * task,
    int * allocated_buffers,
    int * current_buffer,
    int nb_descrs,
    struct starpu_data_descr * descrs)
```

Store nb_descrs data handles described by descrs into task task, updating *allocated_buffers and *current_buffer accordingly.

29.14.3.7 starpu_codelet_pack_args()

```c
void starpu_codelet_pack_args ( 
    void ** arg_buffer,
    size_t * arg_buffer_size,
    ... )
```

Pack arguments of type STARPU_VALUE into a buffer which can be given to a codelet and later unpacked with the function starpu_codelet_unpack_args(). Instead of calling starpu_codelet_pack_args(), one can also call starpu_codelet_pack_arg_init(), then starpu_codelet_pack_arg() for each data, then starpu_codelet_pack_arg_fini().

29.14.3.8 starpu_codelet_pack_arg_init()

```c
void starpu_codelet_pack_arg_init { 
    struct starpu_codelet_pack_arg_data * state )
```

Initialize struct starpu_codelet_pack_arg before calling starpu_codelet_pack_arg() and starpu_codelet_pack_arg_fini(). This will simply initialize the content of the structure.

29.14.3.9 starpu_codelet_pack_arg_fini()

```c
void starpu_codelet_pack_arg_fini { 
    struct starpu_codelet_pack_arg_data * state,
    void ** cl_arg,
    size_t * cl_arg_size }
```

Finish packing data, after calling starpu_codelet_pack_arg_init() once and starpu_codelet_pack_arg() several times.

29.14.3.10 starpu_codelet_unpack_args()

```c
void starpu_codelet_unpack_args ( 
    void * cl_arg,
    ... )
```

Retrieve the arguments of type STARPU_VALUE associated to a task automatically created using the function starpu_task_insert(). If any parameter's value is 0, unpacking will stop there and ignore the remaining parameters.
29.14.3.11 starpu_codelet_unpack_args_and_copyleft()

```c
void starpu_codelet_unpack_args_and_copyleft (  
    void * cl_arg,  
    void * buffer,  
    size_t buffer_size,  
    ... )
```

Similar to `starpu_codelet_unpack_args()`, but if any parameter is 0, copy the part of `cl_arg` that has not been read in `buffer` which can then be used in a later call to one of the unpack functions.

29.14.3.12 starpu_task_build()

```c
struct starpu_task * starpu_task_build (  
    struct starpu_codelet * cl,  
    ... )
```

Create a task corresponding to `cl` with the following arguments. The argument list must be zero-terminated. The arguments following the codelet are the same as the ones for the function `starpu_task_insert()`. If some arguments of type `STARPU_VALUE` are given, the parameter `starpu_task::cl_arg_free` will be set to 1.

29.14.3.13 starpu_task_set()

```c
int starpu_task_set (  
    struct starpu_task * task,  
    struct starpu_codelet * cl,  
    ... )
```

Set the given `task` corresponding to `cl` with the following arguments. The argument list must be zero-terminated. The arguments following the codelet are the same as the ones for the function `starpu_task_insert()`. If some arguments of type `STARPU_VALUE` are given, the parameter `starpu_task::cl_arg_free` will be set to 1.

29.15 Explicit Dependencies

**Typedefs**

- typedef uint64_t starpu_tag_t

**Functions**

- void starpu_task Declare_deps_array (struct starpu_task *task, unsigned ndeps, struct starpu_task *task_array[])
- int starpu_task_get_task_succs (struct starpu_task *task, unsigned ndeps, struct starpu_task *task_array[])

- void starpu_tag Remove (starpu_tag_t id)
- void starpu_tag Notify_from_apps (starpu_tag_t id)
- void starpu_task End_dep_add (struct starpu_task *t, int nb_deps)
- void starpu_task End_dep_release (struct starpu_task *t)

29.15.1 Detailed Description

29.15.2 Typedef Documentation
29.15.2.1 starpu_tag_t

*starpu_tag_t*

Define a task logical identifier. It is possible to associate a task with a unique *tag* chosen by the application, and to express dependencies between tasks by the means of those tags. To do so, fill the field *starpu_task::tag_id* with a tag number (can be arbitrary) and set the field *starpu_task::use_tag* to 1. If *starpu_tag_declare_deps()* is called with this tag number, the task will not be started until the tasks which holds the declared dependency tags are completed.

### 29.15.3 Function Documentation

#### 29.15.3.1 starpu_task_declare_deps_array()

```c
void starpu_task_declare_deps_array(
    struct starpu_task * task,
    unsigned ndeps,
    struct starpu_task * task_array[]
)
```

Declare task dependencies between a task and an array of tasks of length *ndeps*. This function must be called prior to the submission of the task, but it may called after the submission or the execution of the tasks in the array, provided the tasks are still valid (i.e. they were not automatically destroyed). Calling this function on a task that was already submitted or with an entry of *task_array* that is no longer a valid task results in an undefined behaviour. If *ndeps* is 0, no dependency is added. It is possible to call *starpu_task_declare_deps_array()* several times on the same task, in this case, the dependencies are added. It is possible to have redundancy in the task dependencies.

#### 29.15.3.2 starpu_task_get_task_succs()

```c
int starpu_task_get_task_succs(
    struct starpu_task * task,
    unsigned ndeps,
    struct starpu_task * task_array[]
)
```

Fill *task_array* with the list of tasks which are direct children of task. *ndeps* is the size of *task_array*. This function returns the number of direct children. *task_array* can be set to NULL if *ndeps* is 0, which allows to compute the number of children before allocating an array to store them. This function can only be called if *task* has not completed yet, otherwise the results are undefined. The result may also be outdated if some additional dependency has been added in the meanwhile.

#### 29.15.3.3 starpu_task_get_task_scheduled_succs()

```c
int starpu_task_get_task_scheduled_succs(
    struct starpu_task * task,
    unsigned ndeps,
    struct starpu_task * task_array[]
)
```

Behave like *starpu_task_get_task_succs()*, except that it only reports tasks which will go through the scheduler, thus avoiding tasks with not codelet, or with explicit placement.

#### 29.15.3.4 starpu_tag_declare_deps()

```c
void starpu_tag_declare_deps(
    starpu_tag_t id,
    unsigned ndeps,
    ...
)
```

Specify the dependencies of the task identified by tag *id*. The first argument specifies the tag which is configured, the second argument gives the number of tag(s) on which *id* depends. The following arguments are the tags which have to be terminated to unlock the task. This function must be called before the associated task is submitted to StarPU with *starpu_task_submit()*.

**WARNING! Use with caution.** Because of the variable arity of *starpu_tag_declare_deps()*, note that the last arguments must be of type *starpu_tag_t*: constant values typically need to be explicitly casted. Otherwise, due to
integer sizes and argument passing on the stack, the C compiler might consider the tag 0x200000003 instead of 0x2 and 0x3 when calling `starpu_tag_declare_deps(0x1, 2, 0x2, 0x3)`. Using the `starpu_tag_declare_deps_array()` function avoids this hazard.

```c
/* Tag 0x1 depends on tags 0x32 and 0x52 */
starpu_tag_declare_deps[(starpu_tag_t)0x1, 2, (starpu_tag_t)
  0x32, (starpu_tag_t)0x52);
```

### 29.15.3.5 `starpu_tag_declare_deps_array()`

```c
void starpu_tag_declare_deps_array {
    starpu_tag_t id,
    unsigned ndeps,
    starpu_tag_t * array
}
```

Similar to `starpu_tag_declare_deps()`, except that its does not take a variable number of arguments but an array of tags of size `ndeps`.

```c
/* Tag 0x1 depends on tags 0x32 and 0x52 */
starpu_tag_t tag_array[2] = {0x32, 0x52};
starpu_tag_declare_deps_array((starpu_tag_t)0x1, 2, tag_array);
```

### 29.15.3.6 `starpu_tag_wait()`

```c
int starpu_tag_wait ( 
    starpu_tag_t id )
```

Block until the task associated to tag `id` has been executed. This is a blocking call which must therefore not be called within tasks or callbacks, but only from the application directly. It is possible to synchronize with the same tag multiple times, as long as the `starpu_tag_remove()` function is not called. Note that it is still possible to synchronize with a tag associated to a task for which the structure `starpu_task` was freed (e.g. if the field `starpu_task::destroy` was enabled).

### 29.15.3.7 `starpu_tag_wait_array()`

```c
int starpu_tag_wait_array ( 
    unsigned ntags,
    starpu_tag_t * id )
```

Similar to `starpu_tag_wait()` except that it blocks until all the `ntags` tags contained in the array `id` are terminated.

### 29.15.3.8 `starpu_tag_restart()`

```c
void starpu_tag_restart ( 
    starpu_tag_t id )
```

Clear the already notified status of a tag which is not associated with a task. Before that, calling `starpu_tag_notify_from_apps()` again will not notify the successors. After that, the next call to `starpu_tag_notify_from_apps()` will notify the successors.

### 29.15.3.9 `starpu_tag_remove()`

```c
void starpu_tag_remove ( 
    starpu_tag_t id )
```

Release the resources associated to tag `id`. It can be called once the corresponding task has been executed and when there is no other tag that depend on this tag anymore.

### 29.15.3.10 `starpu_tag_notify_from_apps()`

```c
void starpu_tag_notify_from_apps ( 
    starpu_tag_t id )
```
Explicitly unlock tag \texttt{id}. It may be useful in the case of applications which execute part of their computation outside StarPU tasks (e.g. third-party libraries). It is also provided as a convenient tool for the programmer, for instance to entirely construct the task DAG before actually giving StarPU the opportunity to execute the tasks. When called several times on the same tag, notification will be done only on first call, thus implementing "OR" dependencies, until the tag is restarted using \texttt{starpu_tag_restart()}.

\texttt{29.15.3.11 starpu_task_end_dep_add()}

\begin{verbatim}
void starpu_task_end_dep_add ( 
    struct starpu_task * t, 
    int nb_deps )
\end{verbatim}

Add \texttt{nb_deps} end dependencies to the task \texttt{t}. This means the task will not terminate until the required number of calls to the function \texttt{starpu_task_end_dep_release()} has been made.

\texttt{29.15.3.12 starpu_task_end_dep_release()}

\begin{verbatim}
void starpu_task_end_dep_release ( 
    struct starpu_task * t )
\end{verbatim}

Unlock 1 end dependency to the task \texttt{t}. This function must be called after \texttt{starpu_task_end_dep_add()}. 

\section*{29.16 Implicit Data Dependencies}

In this section, we describe how StarPU makes it possible to insert implicit task dependencies in order to enforce sequential data consistency. When this data consistency is enabled on a specific data handle, any data access will appear as sequentially consistent from the application. For instance, if the application submits two tasks that access the same piece of data in read-only mode, and then a third task that access it in write mode, dependencies will be added between the two first tasks and the third one. Implicit data dependencies are also inserted in the case of data accesses from the application.

\textbf{Functions}

- \texttt{void starpu_data_set_default_sequential_consistency_flag (unsigned flag)}
- \texttt{unsigned starpu_data_get_default_sequential_consistency_flag (void)}
- \texttt{void starpu_data_set_sequential_consistency_flag (starpu_data_handle_t handle, unsigned flag)}
- \texttt{unsigned starpu_data_get_sequential_consistency_flag (starpu_data_handle_t handle)}

\subsection*{29.16.1 Detailed Description}

In this section, we describe how StarPU makes it possible to insert implicit task dependencies in order to enforce sequential data consistency. When this data consistency is enabled on a specific data handle, any data access will appear as sequentially consistent from the application. For instance, if the application submits two tasks that access the same piece of data in read-only mode, and then a third task that access it in write mode, dependencies will be added between the two first tasks and the third one. Implicit data dependencies are also inserted in the case of data accesses from the application.

\subsection*{29.16.2 Function Documentation}

\texttt{29.16.2.1 starpu_data_set_default_sequential_consistency_flag()}

\begin{verbatim}
void starpu_data_set_default_sequential_consistency_flag ( 
    unsigned flag )
\end{verbatim}

Set the default sequential consistency flag. If a non-zero value is passed, a sequential data consistency will be enforced for all handles registered after this function call, otherwise it is disabled. By default, StarPU enables sequential data consistency. It is also possible to select the data consistency mode of a specific data handle with the function \texttt{starpu_data_set_sequential_consistency_flag()}. 

\normalfont

\textit{Generated by Doxygen}
29.16.2.2 starpu_data_get_default_sequential_consistency_flag()

unsigned starpu_data_get_default_sequential_consistency_flag (
    void )

Return the default sequential consistency flag.

29.16.2.3 starpu_data_set_sequential_consistency_flag()

void starpu_data_set_sequential_consistency_flag ( 
    starpu_data_handle_t handle,
    unsigned flag )

Set the data consistency mode associated to a data handle. The consistency mode set using this function has the priority over the default mode which can be set with starpu_data_set_default_sequential_consistency_flag().

29.16.2.4 starpu_data_get_sequential_consistency_flag()

unsigned starpu_data_get_sequential_consistency_flag ( 
    starpu_data_handle_t handle )

Get the data consistency mode associated to the data handle handle.

29.17.2.3 struct starpu_perfmodel

Contain all information about a performance model. At least the type and symbol fields have to be filled when defining a performance model for a codelet. For compatibility, make sure to initialize the whole structure to zero, either by using explicit memset, or by letting the compiler implicitly do it in e.g. static storage case. If not provided, other fields have to be zero.

Data Fields

- enum starpu_perfmodel_type type
- double(* cost_function *)(struct starpu_task *, unsigned nimpl)
- double(* arch_cost_function *)(struct starpu_task *, struct starpu_perfmodel_arch +arch, unsigned nimpl)

- unsigned ncombinations
- starpu_perfmodel_state_t state

29.17.2.3.1 Field Documentation

29.17.2.3.1.1 type

enum starpu_perfmodel_type starpu_perfmodel::type
type of performance model

- STARPU_HISTORY_BASED, STARPU_REGRESSION_BASED, STARPU_NL_REGRESSION_BASED:
  No other fields needs to be provided, this is purely history-based.

- STARPU_MULTIPLE_REGRESSION_BASED: Need to provide fields starpu_perfmodel::nparameters (number of different parameters), starpu_perfmodel::ncombinations (number of parameters combinations-tuples) and table starpu_perfmodel::combinations which defines exponents of the equation. Function cl_perf_func also needs to define how to extract parameters from the task.

- STARPU_PER_ARCH: either field starpu_perfmodel::arch_cost_function has to be filled with a function that returns the cost in micro-seconds on the arch given as parameter, or field starpu_perfmodel::per_arch has to be filled with functions which return the cost in micro-seconds.

- STARPU_COMMON: field starpu_perfmodel::cost_function has to be filled with a function that returns the cost in micro-seconds on a CPU, timing on other archs will be determined by multiplying by an arch-specific factor.

29.17.2.3.1.2 cost_function

double(* starpu_perfmodel::cost_function)(struct starpu_task *, unsigned nimpl)
Used by STARPU_COMMON. Take a task and implementation number, and must return a task duration estimation in micro-seconds.

29.17.2.3.1.3 arch_cost_function
double(* starpu_perfmodel::arch_cost_function)(struct starpu_task *, struct starpu_perfmodel_← arch *, unsigned nimpl)
Used by STARPU_COMMON. Take a task, an arch and implementation number, and must return a task duration estimation in micro-seconds on that arch.

29.17.2.3.1.4 size_base

size_t(* starpu_perfmodel::size_base)(struct starpu_task *, unsigned nimpl)
Used by STARPU_HISTORY_BASED, STARPU_REGRESSION_BASED and STARPU_NL_REGRESSION_BASED. If not NULL, take a task and implementation number, and return the size to be used as index to distinguish histories and as a base for regressions.

29.17.2.3.1.5 footprint

uint32_t(* starpu_perfmodel::footprint)(struct starpu_task *)
Used by STARPU_HISTORY_BASED. If not NULL, take a task and return the footprint to be used as index to distinguish histories. The default is to use the starpu_task_data_footprint() function.

29.17.2.3.1.6 symbol

const char * starpu_perfmodel::symbol
symbol name for the performance model, which will be used as file name to store the model. It must be set otherwise the model will be ignored.
29.17.2.3.1.7  is_loaded
unsigned starpu_perfmodel::is_loaded
Whether the performance model is already loaded from the disk.

29.17.2.3.1.8  benchmarking
unsigned starpu_perfmodel::benchmarking
todo

29.17.2.3.1.9  is_init
unsigned starpu_perfmodel::is_init
todo

29.17.2.3.1.10  parameters
void(* starpu_perfmodel::parameters)(struct starpu_task *task, double *parameters)
todo

29.17.2.3.1.11  parameters_names
const char ** starpu_perfmodel::parameters_names
Names of parameters used for multiple linear regression models (M, N, K)

29.17.2.3.1.12  nparameters
unsigned starpu_perfmodel::nparameters
Number of parameters used for multiple linear regression models

29.17.2.3.1.13  combinations
unsigned ** starpu_perfmodel::combinations
Table of combinations of parameters (and the exponents) used for multiple linear regression models

29.17.2.3.1.14  ncombinations
unsigned starpu_perfmodel::ncombinations
Number of combination of parameters used for multiple linear regression models

29.17.2.3.1.15  state
starpu_perfmodel_state_t starpu_perfmodel::state
todo

29.17.2.4  struct starpu_perfmodel_regression_model
todo

struct starpu_perfmodel_history_table * history
The history of performance measurements.

struct starpu_perfmodel_history_list * list
Used by STARPU_HISTORY_BASED, STARPU_NL_REGRESSION_BASED and STARPU_MULTIPLE_REGRESSION_BASED, records all execution history measures.

struct starpu_perfmodel_regression_model regression
Used by STARPU_REGRESSION_BASED, STARPU_NL_REGRESSION_BASED and STARPU_MULTIPLE_REGRESSION_BASED, contains the estimated factors of the regression.

29.17.3 Enumeration Type Documentation

29.17.3.1 starpu_perfmodel_type

```c
enum starpu_perfmodel_type
{
    STARPU_PERFMODEL_INVALID, todo
    STARPU_PER_ARCH, Application-provided per-arch cost model function
    STARPU_COMMON, Application-provided common cost model function, with per-arch factor
    STARPU_HISTORY_BASED, Automatic history-based cost model
    STARPU_REGRESSION_BASED, Automatic linear regression-based cost model (alpha * size^beta)
    STARPU_NL_REGRESSION_BASED, Automatic non-linear regression-based cost model (a * size^b + c)
    STARPU_MULTIPLE_REGRESSION_BASED, Automatic multiple linear regression-based cost model. Application provides parameters, their combinations and exponents.
}
```

29.17.4 Function Documentation

29.17.4.1 starpu_perfmodel_init()

```c
void starpu_perfmodel_init (
    struct starpu_perfmodel * model )
todo
```

29.17.4.2 starpu_perfmodel_free_sampling_directories()

```c
void starpu_perfmodel_free_sampling_directories ( void )
```
Free internal memory used for sampling directory management. It should only be called by an application which is not calling starpu_shutdown() as this function already calls it. See for example tools/starpu_perfmodel-display.c.

29.17.4.3 starpu_perfmodel_load_file()

int starpu_perfmodel_load_file (  
    const char * filename,  
    struct starpu_perfmodel * model )

Load the performance model found in the file named filename. model has to be completely zero, and will be filled with the information stored in the given file.

29.17.4.4 starpu_perfmodel_load_symbol()

int starpu_perfmodel_load_symbol (  
    const char * symbol,  
    struct starpu_perfmodel * model )

Load a given performance model. model has to be completely zero, and will be filled with the information stored in $STARPU_HOME/.starpu. The function is intended to be used by external tools that want to read the performance model files.

29.17.4.5 starpu_perfmodel_unload_model()

int starpu_perfmodel_unload_model (  
    struct starpu_perfmodel * model )

Unload model which has been previously loaded through the function starpu_perfmodel_load_symbol().

29.17.4.6 starpu_perfmodel_debugfilepath()

void starpu_perfmodel_debugfilepath (  
    struct starpu_perfmodel * model,  
    struct starpu_perfmodel_arch * arch,  
    char * path,  
    size_t maxlen,  
    unsigned nimpl )

Return the path to the debugging information for the performance model.

29.17.4.7 starpu_perfmodel_get_archtype_name()

char * starpu_perfmodel_get_archtype_name (  
    enum starpu_worker_archtype archtype )

todo

29.17.4.8 starpu_perfmodel_get_arch_name()

void starpu_perfmodel_get_arch_name (  
    struct starpu_perfmodel_arch * arch,  
    char * archname,  
    size_t maxlen,  
    unsigned nimpl )

Return the architecture name for arch.

29.17.4.9 starpu_worker_get_perf_archtype()

struct starpu_perfmodel_arch * starpu_worker_get_perf_archtype (  
    int workerid,  
    unsigned sched_ctx_id )

Return the architecture type of the worker workerid.
29.17.4.10  starpu_perfmodel_initialize()

void starpu_perfmodel_initialize (  
    void )

If starpu_init is not used, starpu_perfmodel_initialize should be used before calling starpu_perfmodel_* functions.

29.17.4.11  starpu_perfmodel_list()

int starpu_perfmodel_list (  
    FILE * output )

Print a list of all performance models on output

29.17.4.12  starpu_perfmodel_directory()

void starpu_perfmodel_directory (  
    FILE * output )

Print the directory name storing performance models on output

29.17.4.13  starpu_perfmodel_print()

void starpu_perfmodel_print (  
    struct starpu_perfmodel * model,  
    struct starpu_perfmodel_arch * arch,  
    unsigned nimpl,  
    char * parameter,  
    uint32_t * footprint,  
    FILE * output )

todo

29.17.4.14  starpu_perfmodel_print_all()

int starpu_perfmodel_print_all (  
    struct starpu_perfmodel * model,  
    char * arch,  
    char * parameter,  
    uint32_t * footprint,  
    FILE * output )

todo

29.17.4.15  starpu_perfmodel_print_estimations()

int starpu_perfmodel_print_estimations (  
    struct starpu_perfmodel * model,  
    uint32_t footprint,  
    FILE * output )

todo

29.17.4.16  starpu_bus_print_bandwidth()

void starpu_bus_print_bandwidth (  
    FILE * f )

Print a matrix of bus bandwidths on f.

29.17.4.17  starpu_bus_print_affinity()

void starpu_bus_print_affinity (  
    FILE * f )

Print the affinity devices on f.
29.17.4.18 starpu_bus_print_filenames()

```c
void starpu_bus_print_filenames ( 
    FILE * f )
```

Print on `f` the name of the files containing the matrix of bus bandwidths, the affinity devices and the latency.

29.17.4.19 starpu_perfmodel_update_history()

```c
void starpu_perfmodel_update_history ( 
    struct starpu_perfmodel * model,
    struct starpu_task * task,
    struct starpu_perfmodel_arch * arch,
    unsigned cpuid,
    unsigned nimpl,
    double measured )
```

Feed the performance model model with an explicit measurement measured (in µs), in addition to measurements done by StarPU itself. This can be useful when the application already has an existing set of measurements done in good conditions, that StarPU could benefit from instead of doing on-line measurements. An example of use can be seen in Performance Model Example.

29.17.4.20 starpu_transfer_bandwidth()

```c
double starpu_transfer_bandwidth ( 
    unsigned src_node,
    unsigned dst_node )
```

Return the bandwidth of data transfer between two memory nodes

29.17.4.21 starpu_transfer_latency()

```c
double starpu_transfer_latency ( 
    unsigned src_node,
    unsigned dst_node )
```

Return the latency of data transfer between two memory nodes

29.17.4.22 starpu_transfer_predict()

```c
double starpu_transfer_predict ( 
    unsigned src_node,
    unsigned dst_node,
    size_t size )
```

Return the estimated time to transfer a given size between two memory nodes.

29.17.4.23 starpu_perfmodel_history_based_expected_perf()

```c
double starpu_perfmodel_history_based_expected_perf ( 
    struct starpu_perfmodel * model,
    struct starpu_perfmodel_arch * arch,
    uint32_t footprint )
```

Return the estimated time of a task with the given model and the given footprint.

29.18.1 Detailed Description

29.18.2 Data Structure Documentation

29.18.2.1 `struct starpu_profiling_task_info`

This structure contains information about the execution of a task. It is accessible from the field `starpu_task::profiling_info` if profiling was enabled.

Data Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>struct timespec submit_time</td>
<td>Date of task submission (relative to the initialization of StarPU).</td>
</tr>
<tr>
<td>struct timespec push_start_time</td>
<td>Time when the task was submitted to the scheduler.</td>
</tr>
<tr>
<td>struct timespec push_end_time</td>
<td>Time when the scheduler finished with the task submission.</td>
</tr>
<tr>
<td>struct timespec pop_start_time</td>
<td>Time when the scheduler started to be requested for a task, and eventually gave that task.</td>
</tr>
<tr>
<td>struct timespec pop_end_time</td>
<td>Time when the scheduler finished providing the task for execution.</td>
</tr>
<tr>
<td>struct timespec acquire_data_start_time</td>
<td>Time when the worker started fetching input data.</td>
</tr>
<tr>
<td>struct timespec acquire_data_end_time</td>
<td>Time when the worker finished fetching input data.</td>
</tr>
<tr>
<td>struct timespec start_time</td>

</tbody>
</table>

29.18.3 Macro Definition Documentation

29.18.3.1 STARPU_PROFILING_DISABLE

`STARPU_PROFILING_DISABLE`

Used when calling the function `starpu_profiling_status_set()` to disable profiling.

29.18.3.2 STARPU_PROFILING_ENABLE

`STARPU_PROFILING_ENABLE`

Used when calling the function `starpu_profiling_status_set()` to enable profiling.
29.18.4 Function Documentation

29.18.4.1 starpu_profiling_status_set()

```c
int starpu_profiling_status_set ( int status )
```

Set the profiling status. Profiling is activated by passing STARPU_PROFILING_ENABLE in `status`. Passing STARPU_PROFILING_DISABLE disables profiling. Calling this function resets all profiling measurements. When profiling is enabled, the field `starpu_task::profiling_info` points to a valid structure `starpu_profiling_task_info` containing information about the execution of the task. Negative return values indicate an error, otherwise the previous status is returned.

29.18.4.2 starpu_profiling_status_get()

```c
int starpu_profiling_status_get ( void )
```

Return the current profiling status or a negative value in case there was an error.

29.18.4.3 starpu_profiling_init()

```c
void starpu_profiling_init ( void )
```

Reset performance counters and enable profiling if the environment variable STARPU_PROFILING is set to a positive value.

29.18.4.4 starpu_profiling_set_id()

```c
void starpu_profiling_set_id ( int new_id )
```

Set the ID used for profiling trace filename. HAS to be called before `starpu_init()`.

29.18.4.5 starpu_profiling_worker_get_info()

```c
int starpu_profiling_worker_get_info ( int workerid, struct starpu_profiling_worker_info * worker_info )
```

Get the profiling info associated to the worker identified by `workerid`, and reset the profiling measurements. If the argument `worker_info` is NULL, only reset the counters associated to worker `workerid`. Upon successful completion, this function returns 0. Otherwise, a negative value is returned.

29.18.4.6 starpu_bus_get_profiling_info()

```c
int starpu_bus_get_profiling_info ( int busid, struct starpu_profiling_bus_info * bus_info )
```

todo

29.18.4.7 starpu_bus_get_count()

```c
int starpu_bus_get_count ( void )
```

Return the number of buses in the machine

29.18.4.8 starpu_bus_get_id()

```c
int starpu_bus_get_id ( int src, int dst )
```
29.19 Theoretical Lower Bound on Execution Time

Compute theoretical upper computation efficiency bound corresponding to some actual execution.

Functions

- void starpu_bound_start (int deps, int prio)
- void starpu_bound_stop (void)
- void starpu_bound_print_dot (FILE *output)
- void starpu_bound_compute (double *res, double *integer_res, int integer)
- void starpu_bound_print_lp (FILE *output)
29.19.1 Detailed Description

Compute theoretical upper computation efficiency bound corresponding to some actual execution.

29.19.2 Function Documentation

29.19.2.1 starpu_bound_start()

```c
void starpu_bound_start ( int deps,
                          int prio )
```

Start recording tasks (resets stats). deps tells whether dependencies should be recorded too (this is quite expensive).

29.19.2.2 starpu_bound_stop()

```c
void starpu_bound_stop ( void )
```

Stop recording tasks.

29.19.2.3 starpu_bound_print_dot()

```c
void starpu_bound_print_dot ( FILE * output )
```

Emit the DAG that was recorded on output.

29.19.2.4 starpu_bound_compute()

```c
void starpu_bound_compute ( double * res,
                            double * integer_res,
                            int integer )
```

Get theoretical upper bound (in ms) (needs glpk support detected by configure script). It returns 0 if some performance models are not calibrated.

29.19.2.5 starpu_bound_print_lp()

```c
void starpu_bound_print_lp ( FILE * output )
```

Emit the Linear Programming system on output for the recorded tasks, in the lp format.

29.19.2.6 starpu_bound_print_mps()

```c
void starpu_bound_print_mps ( FILE * output )
```

Emit the Linear Programming system on output for the recorded tasks, in the mps format.

29.19.2.7 starpu_bound_print()

```c
void starpu_bound_print ( FILE * output,
                         int integer )
```

Emit on output the statistics of actual execution vs theoretical upper bound. integer permits to choose between integer solving (which takes a long time but is correct), and relaxed solving (which provides an approximate solution).
29.20 CUDA Extensions

Macros

- \#define STARPU_USE_CUDA
- \#define STARPU_MAXCUDADEVS
- \#define STARPU_CUDA_REPORT_ERROR(status)
- \#define STARPU_CUBLAS_REPORT_ERROR(status)

Functions

- cudaStream_t starpu_cuda_get_local_stream (void)
- const struct cudaDeviceProp * starpu_cuda_get_device_properties (unsigned workerid)
- void starpu_cuda_report_error (const char *func, const char *file, int line, cudaError_t status)
- int starpu_cuda_copy_async_sync (void *src_ptr, unsigned src_node, void *dst_ptr, unsigned dst_node, size_t ssize, cudaStream_t stream, enum cudaMemcpyKind kind)
- void starpu_cuda_set_device (unsigned devid)
- void starpu_cublas_init (void)
- void starpu_cublas_set_stream (void)
- void starpu_cublas_shutdown (void)
- void starpu_cublas_report_error (const char *func, const char *file, int line, int status)

29.20.1 Detailed Description

29.20.2 Macro Definition Documentation

29.20.2.1 STARPU_USE_CUDA

\#define STARPU_USE_CUDA
This macro is defined when StarPU has been installed with CUDA support. It should be used in your code to detect the availability of CUDA as shown in Full source code for the 'Scaling a Vector' example.

29.20.2.2 STARPU_MAXCUDADEVS

\#define STARPU_MAXCUDADEVS
This macro defines the maximum number of CUDA devices that are supported by StarPU.

29.20.2.3 STARPU_CUDA_REPORT_ERROR

\#define STARPU_CUDA_REPORT_ERROR(
  status )
Calls starpu_cuda_report_error(), passing the current function, file and line position.

29.20.2.4 STARPU_CUBLAS_REPORT_ERROR

\#define STARPU_CUBLAS_REPORT_ERROR(
  status )
Calls starpu_cublas_report_error(), passing the current function, file and line position.

29.20.3 Function Documentation

Generated by Doxygen
29.20.3.1 starpu_cuda_get_local_stream()

cudaStream_t starpu_cuda_get_local_stream ( void )

Return the current worker's CUDA stream. StarPU provides a stream for every CUDA device controlled by StarPU. This function is only provided for convenience so that programmers can easily use asynchronous operations within codelets without having to create a stream by hand. Note that the application is not forced to use the stream provided by starpu_cuda_get_local_stream() and may also create its own streams. Synchronizing with cudaThreadSynchronize() is allowed, but will reduce the likelihood of having all transfers overlapped.

29.20.3.2 starpu_cuda_get_device_properties()

const struct cudaDeviceProp * starpu_cuda_get_device_properties ( unsigned workerid )

Return a pointer to device properties for worker workerid (assumed to be a CUDA worker).

29.20.3.3 starpu_cuda_report_error()

void starpu_cuda_report_error ( const char * func, const char * file, int line, cudaError_t status )

Report a CUDA error.

29.20.3.4 starpu_cuda_copy_async_sync()

int starpu_cuda_copy_async_sync ( void * src_ptr, unsigned src_node, void * dst_ptr, unsigned dst_node, size_t ssize, cudaStream_t stream, enum cudaMemcpyKind kind )

Copy ssize bytes from the pointer src_ptr on src_node to the pointer dst_ptr on dst_node. The function first tries to copy the data asynchronous (unless stream is NULL). If the asynchronous copy fails or if stream is NULL, it copies the data synchronously. The function returns -EAGAIN if the asynchronous launch was successfull. It returns 0 if the synchronous copy was successful, or fails otherwise.

29.20.3.5 starpu_cuda_set_device()

void starpu_cuda_set_device ( unsigned devid )

Calls cudaSetDevice(devid) or cudaGLSetGLDevice(devid), according to whether devid is among the field starpu_conf::cuda_opengl_interoperability.

29.20.3.6 starpu_cublas_init()

void starpu_cublas_init ( void )

This function initializes CUBLAS on every CUDA device. The CUBLAS library must be initialized prior to any CUBLAS call. Calling starpu_cublas_init() will initialize CUBLAS on every CUDA device controlled by StarPU. This call blocks until CUBLAS has been properly initialized on every device.

29.20.3.7 starpu_cublas_set_stream()

void starpu_cublas_set_stream ( void )
This function sets the proper CUBLAS stream for CUBLAS v1. This must be called from the CUDA codelet before calling CUBLAS v1 kernels, so that they are queued on the proper CUDA stream. When using one thread per CUDA worker, this function does not do anything since the CUBLAS stream does not change, and is set once by starpu_cublas_init().

29.20.3.8 starpu_cublas_shutdown()

```c
void starpu_cublas_shutdown ( )
```

This function synchronously deinitializes the CUBLAS library on every CUDA device.

29.20.3.9 starpu_cublas_report_error()

```c
void starpu_cublas_report_error ( const char * func,
                                   const char * file,
                                   int line,
                                   int status )
```

Report a cublas error.

29.21 OpenCL Extensions

Data Structures

- struct starpu_opencl_program

Macros

- #define STARPU_USE_OPENCL
- #define STARPU_MAXOPENCLDEVS
- #define STARPU_OPENCL_DATADIR

Writing OpenCL kernels

- void starpu_opencl_get_context (int devid, cl_context *context)
- void starpu_opencl_get_device (int devid, cl_device_id *device)
- void starpu_opencl_get_queue (int devid, cl_command_queue *queue)
- void starpu_opencl_get_current_context (cl_context *context)
- void starpu_opencl_get_current_queue (cl_command_queue *queue)
- int starpu_opencl_set_kernel_args (cl_int *err, cl_kernel *kernel,...)

Compiling OpenCL kernels

Source codes for OpenCL kernels can be stored in a file or in a string. StarPU provides functions to build the program executable for each available OpenCL device as a cl_program object. This program executable can then be loaded within a specific queue as explained in the next section. These are only helpers, Applications can also fill a starpu_opencl_program array by hand for more advanced use (e.g. different programs on the different OpenCL devices, for relocation purpose for instance).

- int starpu_opencl_load_opencl_from_file (const char *source_file_name, struct starpu_opencl_program *opencl_programs, const char *build_options)
- int starpu_opencl_load_opencl_from_string (const char *opencl_program_source, struct starpu_opencl_program *opencl_programs, const char *build_options)
- int starpu_opencl_unload_opencl (struct starpu_opencl_program *opencl_programs)
- void starpu_opencl_load_program_source (const char *source_file_name, char *located_file_name, char *located_dir_name, char *opencl_program_source)
- void starpu_opencl_load_program_source_malloc (const char *source_file_name, char **located_file_name, char **located_dir_name, char **opencl_program_source)
• int starpu_opencl_compile_opencl_from_file (const char *source_file_name, const char *build_options)
• int starpu_opencl_compile_opencl_from_string (const char *opencl_program_source, const char *file_name, const char *build_options)
• int starpu_opencl_load_binary_opencl (const char *kernel_id, struct starpu_opencl_program *opencl_programs)

Loading OpenCL kernels
• int starpu_opencl_load_kernel (cl_kernel *kernel, cl_command_queue *queue, struct starpu_opencl_program *opencl_programs, const char *kernel_name, int devid)
• int starpu_opencl_release_kernel (cl_kernel kernel)

OpenCL statistics
• int starpu_opencl_collect_stats (cl_event event)

OpenCL utilities
• #define STARPU_OPENCL_DISPLAY_ERROR(status)
• #define STARPU_OPENCL_REPORT_ERROR(status)
• #define STARPU_OPENCL_REPORT_ERROR_WITH_MSG(msg, status)
• const char *starpu_opencl_error_string (cl_int status)
• void starpu_opencl_display_error (const char *func, const char *file, int line, const char *msg, cl_int status)
• static __starpu_inline void starpu_opencl_report_error (const char *func, const char *file, int line, const char *msg, cl_int status)
• cl_int starpu_opencl_allocate_memory (int devid, cl_mem *addr, size_t size, cl_mem_flags flags)
• cl_int starpu_opencl_copy_ram_to_opencl (void *ptr, unsigned src_node, cl_mem buffer, unsigned dst_node, size_t size, size_t offset, cl_event *event, int *ret)
• cl_int starpu_opencl_copy_opencl_to_ram (cl_mem buffer, unsigned src_node, void *ptr, unsigned dst_node, size_t size, size_t offset, cl_event *event, int *ret)
• cl_int starpu_opencl_copy_opencl_to_opencl (cl_mem src, unsigned src_node, size_t src_offset, cl_mem dst, unsigned dst_node, size_t dst_offset, size_t size, cl_event *event, int *ret)
• cl_int starpu_opencl_copy_async_sync (uintptr_t src, size_t src_offset, unsigned src_node, uintptr_t dst, size_t dst_offset, unsigned dst_node, size_t size, cl_event *event)

29.21.1 Detailed Description
29.21.2 Data Structure Documentation
29.21.2.1 struct starpu_opencl_program
Store the OpenCL programs as compiled for the different OpenCL devices.

Data Fields

| cl_program | programs[STARPU_MAXOPENCLDEVS] | Store each program for each OpenCL device. |

29.21.3 Macro Definition Documentation
29.21.3.1 STARPU_USE_OPENCL
#define STARPU_USE_OPENCL
Defined when StarPU has been installed with OpenCL support. It should be used in your code to detect the availability of OpenCL as shown in Full source code for the 'Scaling a Vector' example.

Generated by Doxygen
29.21.3.2 STARPU_MAXOPENCLDEVS

#define STARPU_MAXOPENCLDEVS
Define the maximum number of OpenCL devices that are supported by StarPU.

29.21.3.3 STARPU_OPENCL_DATADIR

#define STARPU_OPENCL_DATADIR
Define the directory in which the OpenCL codelets of the applications provided with StarPU have been installed.

29.21.3.4 STARPU_OPENCL_DISPLAY_ERROR

#define STARPU_OPENCL_DISPLAY_ERROR(
    status
)
Call the function starpu_opencl_display_error() with the error status, the current function name, current file and line number, and a empty message.

29.21.3.5 STARPU_OPENCL_REPORT_ERROR

#define STARPU_OPENCL_REPORT_ERROR(
    status
)
Call the function starpu_opencl_report_error() with the error status, the current function name, current file and line number, and a empty message.

29.21.3.6 STARPU_OPENCL_REPORT_ERROR_WITH_MSG

#define STARPU_OPENCL_REPORT_ERROR_WITH_MSG(
    msg,
    status
)
Call the function starpu_opencl_report_error() with msg and status, the current function name, current file and line number.

29.21.4 Function Documentation

29.21.4.1 starpu_opencl_get_context()

void starpu_opencl_get_context ( 
    int devid,
    cl_context * context )
Return the OpenCL context of the device designated by devid in context.

29.21.4.2 starpu_opencl_get_device()

void starpu_opencl_get_device ( 
    int devid,
    cl_device_id * device )
Return the cl_device_id corresponding to devid in device.

29.21.4.3 starpu_opencl_get_queue()

void starpu_opencl_get_queue ( 
    int devid,
    cl_command_queue * queue )
Return the command queue of the device designated by devid into queue.
29.21.4.4 starpu_opencl_get_current_context()

```c
void starpu_opencl_get_current_context (  
    cl_context * context )
```

Return the context of the current worker.

29.21.4.5 starpu_opencl_get_current_queue()

```c
void starpu_opencl_get_current_queue (  
    cl_command_queue * queue )
```

Return the computation kernel command queue of the current worker.

29.21.4.6 starpu_opencl_set_kernel_args()

```c
int starpu_opencl_set_kernel_args (  
    cl_int * err,  
    cl_kernel * kernel,  
    ... )
```

Set the arguments of a given kernel. The list of arguments must be given as 
(size_t size_of_the_argument, cl_mem * pointer_to_the_argument). The last argument must be 0. Return the number of arguments that were successfully set. In case of failure, return the id of the argument that could not be set and `err` is set to the error returned by OpenCL. Otherwise, return the number of arguments that were set.

Here an example:

```c
int n;
cl_int err;
cl_kernel kernel;
int n = starpu_opencl_set_kernel_args(&err, 2, &kernel, sizeof(foo), &foo, sizeof(bar), &bar, 0);
if (n != 2)
    fprintf(stderr, "Error : %d\n", err);
```

29.21.4.7 starpu_opencl_load_opencl_from_file()

```c
int starpu_opencl_load_opencl_from_file (  
    const char * source_file_name,  
    struct starpu_opencl_program * opencl_programs,  
    const char * build_options )
```

Compile an OpenCL source code stored in a file.

29.21.4.8 starpu_opencl_load_opencl_from_string()

```c
int starpu_opencl_load_opencl_from_string (  
    const char * opencl_program_source,  
    struct starpu_opencl_program * opencl_programs,  
    const char * build_options )
```

Compile an OpenCL source code stored in a string.

29.21.4.9 starpu_opencl_unload_opencl()

```c
int starpu_opencl_unload_opencl (  
    struct starpu_opencl_program * opencl_programs )
```

Unload an OpenCL compiled code.

29.21.4.10 starpu_opencl_load_program_source()

```c
void starpu_opencl_load_program_source (  
    const char * source_file_name,  
    char * located_file_name,  
    char * located_dir_name,  
    char * opencl_program_source )
```
Store the contents of the file source_file_name in the buffer opencl_program_source. The file source_file_name can be located in the current directory, or in the directory specified by the environment variable STARPU_OPENCL_PROGRAM_DIR, or in the directory share/starpu/opencl of the installation directory of StarPU, or in the source directory of StarPU. When the file is found, located_file_name is the full name of the file as it has been located on the system, located_dir_name the directory where it has been located. Otherwise, they are both set to the empty string.

29.21.4.11 starpu_opencl_load_program_source_malloc()

void starpu_opencl_load_program_source_malloc (  
    const char * source_file_name,  
    char ** located_file_name,  
    char ** located_dir_name,  
    char ** opencl_program_source  
)  

Similar to function starpu_opencl_load_program_source() but allocate the buffers located_file_name, located_dir_name and opencl_program_source.

29.21.4.12 starpu_opencl_compile_opencl_from_file()

int starpu_opencl_compile_opencl_from_file (  
    const char * source_file_name,  
    const char * build_options  
)  

Compile the OpenCL kernel stored in the file source_file_name with the given options build_options and store the result in the directory $STARPU_HOME/.starpu/opencl with the same filename as source_file_name. The compilation is done for every OpenCL device, and the filename is suffixed with the vendor id and the device id of the OpenCL device.

29.21.4.13 starpu_opencl_compile_opencl_from_string()

int starpu_opencl_compile_opencl_from_string (  
    const char * opencl_program_source,  
    const char * file_name,  
    const char * build_options  
)  

Compile the OpenCL kernel in the string opencl_program_source with the given options build_options and store the result in the directory $STARPU_HOME/.starpu/opencl with the filename file_name. The compilation is done for every OpenCL device, and the filename is suffixed with the vendor id and the device id of the OpenCL device.

29.21.4.14 starpu_opencl_load_binary_opencl()

int starpu_opencl_load_binary_opencl (  
    const char * kernel_id,  
    struct starpu_opencl_program * opencl_programs  
)  

Compile the binary OpenCL kernel identified with kernel_id. For every OpenCL device, the binary OpenCL kernel will be loaded from the file $STARPU_HOME/.starpu/opencl/<kernel_id>.<device_type>.vendor_id_<vendor_id>_device_id_<device_id>.

29.21.4.15 starpu_opencl_load_kernel()

int starpu_opencl_load_kernel (  
    cl_kernel * kernel,  
    cl_command_queue * queue,  
    struct starpu_opencl_program * opencl_programs,  
    const char * kernel_name,  
    int devid  
)  

Create a kernel kernel for device devid, on its computation command queue returned in queue, using program opencl_programs and name kernel_name.
29.21.4.16 starpu_opencl_release_kernel()

    int starpu_opencl_release_kernel (  
        cl_kernel kernel )

Release the given kernel, to be called after kernel execution.

29.21.4.17 starpu_opencl_collect_stats()

    int starpu_opencl_collect_stats (  
        cl_event event )

Collect statistics on a kernel execution. After termination of the kernels, the OpenCL codelet should call this function with the event returned by clEnqueueNDRangeKernel(), to let StarPU collect statistics about the kernel execution (used cycles, consumed energy).

29.21.4.18 starpu_opencl_error_string()

    const char * starpu_opencl_error_string (  
        cl_int status )

Return the error message in English corresponding to status, an OpenCL error code.

29.21.4.19 starpu_opencl_display_error()

    void starpu_opencl_display_error (  
        const char * func,  
        const char * file,  
        int line,  
        const char * msg,  
        cl_int status )

Given a valid error status, print the corresponding error message on stdout, along with the function name func, the filename file, the line number line and the message msg.

29.21.4.20 starpu_opencl_report_error()

    void starpu_opencl_report_error (  
        const char * func,  
        const char * file,  
        int line,  
        const char * msg,  
        cl_int status ) [static]

Call the function starpu_opencl_display_error() and abort.

29.21.4.21 starpu_opencl_allocate_memory()

    cl_int starpu_opencl_allocate_memory (  
        int devid,  
        cl_mem * addr,  
        size_t size,  
        cl_mem_flags flags )

Allocate size bytes of memory, stored in addr. flags must be a valid combination of cl_mem_flags values.

29.21.4.22 starpu_opencl_copy_ram_to_opencl()

    cl_int starpu_opencl_copy_ram_to_opencl {  
        void * ptr,  
        unsigned src_node,  
        cl_mem buffer,  
        unsigned dst_node,  
        size_t size,  
        size_t offset,
Copy `size` bytes from the given `ptr` on RAM `src_node` to the given `buffer` on OpenCL `dst_node`. `offset` is the offset, in bytes, in `buffer`. If `event` is `NULL`, the copy is synchronous, i.e. the queue is synchronised before returning. If not `NULL`, `event` can be used after the call to wait for this particular copy to complete. This function returns `CL_SUCCESS` if the copy was successful, or a valid OpenCL error code otherwise. The integer pointed to by `ret` is set to `-EAGAIN` if the asynchronous launch was successful, or to 0 if `event` was `NULL`.

29.21.4.23 `starpu_opencl_copy_opencl_to_ram()`

```c
cl_int starpu_opencl_copy_opencl_to_ram {
    cl_mem buffer,
    unsigned src_node,
    void * ptr,
    unsigned dst_node,
    size_t size,
    size_t offset,
    cl_event * event,
    int * ret
}
```

Copy `size` bytes asynchronously from the given `buffer` on OpenCL `src_node` to the given `ptr` on RAM `dst_node`. `offset` is the offset, in bytes, in `buffer`. If `event` is `NULL`, the copy is synchronous, i.e. the queue is synchronised before returning. If not `NULL`, `event` can be used after the call to wait for this particular copy to complete. This function returns `CL_SUCCESS` if the copy was successful, or a valid OpenCL error code otherwise. The integer pointed to by `ret` is set to `-EAGAIN` if the asynchronous launch was successful, or to 0 if `event` was `NULL`.

29.21.4.24 `starpu_opencl_copy_opencl_to_opencl()`

```c
cl_int starpu_opencl_copy_opencl_to_opencl {
    cl_mem src,
    unsigned src_node,
    size_t src_offset,
    cl_mem dst,
    unsigned dst_node,
    size_t dst_offset,
    size_t size,
    cl_event * event,
    int * ret
}
```

Copy `size` bytes asynchronously from byte offset `src_offset` of `src` on OpenCL `src_node` to byte offset `dst_offset` of `dst` on OpenCL `dst_node`. If `event` is `NULL`, the copy is synchronous, i.e. the queue is synchronised before returning. If not `NULL`, `event` can be used after the call to wait for this particular copy to complete. This function returns `CL_SUCCESS` if the copy was successful, or a valid OpenCL error code otherwise. The integer pointed to by `ret` is set to `-EAGAIN` if the asynchronous launch was successful, or to 0 if `event` was `NULL`.

29.21.4.25 `starpu_opencl_copy_async_sync()`

```c
cl_int starpu_opencl_copy_async_sync {
    uintptr_t src,
    size_t src_offset,
    unsigned src_node,
    uintptr_t dst,
    size_t dst_offset,
    unsigned dst_node,
    size_t size,
    cl_event * event
}
```

Copy `size` bytes from byte offset `src_offset` of `src` on OpenCL `src_node` to byte offset `dst_offset` of `dst` on OpenCL `dst_node`. If `event` is `NULL`, the copy is synchronous, i.e. the queue is synchronised before returning. If not
NULL, event can be used after the call to wait for this particular copy to complete. The function returns -EAGAIN if the asynchronous launch was successful. It returns 0 if the synchronous copy was successful, or fails otherwise.

### 29.22 OpenMP Runtime Support

This section describes the interface provided for implementing OpenMP runtimes on top of StarPU.

#### Data Structures

- struct starpu_omp_lock_t
- struct starpu_omp_nest_lock_t
- struct starpu_omp_parallel_region_attr
- struct starpu_omp_task_region_attr

#### Enumerations

- enum starpu_omp_sched_value {
  starpu_omp_sched_undefined, starpu_omp_sched_static, starpu_omp_sched_dynamic, starpu_omp_sched_guided,
  starpu_omp_sched_auto, starpu_omp_sched_runtime
}

- enum starpu_omp_proc_bind_value {
  starpu_omp_proc_bind_undefined, starpu_omp_proc_bind_false, starpu_omp_proc_bind_true, starpu_omp_proc_bind_master,
  starpu_omp_proc_bind_close, starpu_omp_proc_bind_spread
}

#### Initialisation

- #define STARPU_OPENMP
- int starpu_omp_init (void) __STARPU_OMP_NOTHROW
- void starpu_omp_shutdown (void) __STARPU_OMP_NOTHROW

#### Parallel

- void starpu_omp_parallel_region (const struct starpu_omp_parallel_region_attr *attr) __STARPU_OMP_NOTHROW
- void starpu_omp_master (void (*)(void *arg), void *arg) __STARPU_OMP_NOTHROW
- int starpu_omp_master_inline (void) __STARPU_OMP_NOTHROW

#### Synchronization

- void starpu_omp_barrier (void) __STARPU_OMP_NOTHROW
- void starpu_omp_critical (void (*)(void *arg, void *arg, const char *name) __STARPU_OMP_NOTHROW
- void starpu_omp_critical_inline_begin (const char *name) __STARPU_OMP_NOTHROW

29.22.1 Detailed Description

This section describes the interface provided for implementing OpenMP runtimes on top of StarPU.

29.22.2 Data Structure Documentation

29.22.2.1 struct starpu_omp_lock_t

Opaque Simple Lock object (Simple Locks) for inter-task synchronization operations.

See also

starpu_omp_init_lock()
starpu_omp_destroy_lock()
starpu_omp_set_lock()
starpu_omp_unset_lock()
starpu_omp_test_lock()

Data Fields

| void * | internal | Is an opaque pointer for internal use. |

29.22.2.2 struct starpu_omp_nest_lock_t

Opaque Nestable Lock object (Nestable Locks) for inter-task synchronization operations.

See also

starpu_omp_init_nest_lock()
starpu_omp_destroy_nest_lock()
starpu_omp_set_nest_lock()
starpu_omp_unset_nest_lock()
starpu_omp_test_nest_lock()

29.22.3 Macro Definition Documentation

29.22.3.1 STARPU_OPENMP

#define STARPU_OPENMP

This macro is defined when StarPU has been installed with OpenMP Runtime support. It should be used in your code to detect the availability of the runtime support for OpenMP.

29.22.4 Enumeration Type Documentation

29.22.4.1 starpu_omp_sched_value

enum starpu_omp_sched_value

Set of constants for selecting the for loop iteration scheduling algorithm (Parallel For) as defined by the OpenMP specification.

Enumerator

<table>
<thead>
<tr>
<th>starpu_omp_sched_undefined</th>
<th>Undefined iteration scheduling algorithm.</th>
</tr>
</thead>

This function can be used to implement #pragma omp parallel.</td>
</tr>
<tr>
<td>starpu_omp_master()</td>
<td>Executes a function only on the master thread of the OpenMP parallel region it is called from. When called from a thread that is not the master of the parallel region it is called from, this function does nothing. f is the function to be called. arg is an argument passed to function f. This function can be used to implement #pragma omp master.</td>
</tr>
<tr>
<td>starpu_omp_master_inline()</td>
<td>Determines whether the calling thread is the master of the OpenMP parallel region it is called from or not. This function can be used to implement #pragma omp master without code outlining.</td>
</tr>
</tbody>
</table>
Returns

- !0 if called by the region's master thread.
- 0 if not called by the region's master thread.

### 29.22.5.6 starpu_omp_barrier()

```c
void starpu_omp_barrier ( void )
```

Waits until each participating thread of the innermost OpenMP parallel region has reached the barrier and each explicit OpenMP task bound to this region has completed its execution.

This function can be used to implement `#pragma omp barrier`.

### 29.22.5.7 starpu_omp_critical()

```c
void starpu_omp_critical ( void ( ∗ ) ( void ∗ arg ),
                          void ∗ arg,
                          const char ∗ name )
```

Waits until no other thread is executing within the context of the selected critical section, then proceeds to the exclusive execution of a function within the critical section. `f` is the function to be executed in the critical section. `arg` is an argument passed to function `f`. `name` is the name of the selected critical section. If `name == NULL`, the selected critical section is the unique anonymous critical section.

This function can be used to implement `#pragma omp critical`.

### 29.22.5.8 starpu_omp_critical_inline_begin()

```c
void starpu_omp_critical_inline_begin ( const char ∗ name )
```

Waits until execution can proceed exclusively within the context of the selected critical section. `name` is the name of the selected critical section. If `name == NULL`, the selected critical section is the unique anonymous critical section.

This function together with `starpu_omp_critical_inline_end` can be used to implement `#pragma omp critical` without code outlining.

### 29.22.5.9 starpu_omp_critical_inline_end()

```c
void starpu_omp_critical_inline_end ( const char ∗ name )
```

Ends the exclusive execution within the context of the selected critical section. `name` is the name of the selected critical section. If `name==NULL`, the selected critical section is the unique anonymous critical section.

This function together with `starpu_omp_critical_inline_begin` can be used to implement `#pragma omp critical` without code outlining.

### 29.22.5.10 starpu_omp_single()

```c
void starpu_omp_single ( void ( ∗ ) ( void ∗ arg ),
                        void ∗ arg,
                        int nowait )
```

Ensures that a single participating thread of the innermost OpenMP parallel region executes a function. `f` is the function to be executed by a single thread. `arg` is an argument passed to function `f`. `nowait` is a flag indicating whether an implicit barrier is requested after the single section (`nowait==0`) or not (`nowait==!0`).

This function can be used to implement `#pragma omp single`.

### 29.22.5.11 starpu_omp_single_inline()

```c
int starpu_omp_single_inline ( void )
```
Decides whether the current thread is elected to run the following single section among the participating threads of the innermost OpenMP parallel region.
This function can be used to implement `#pragma omp single` without code outlining.

Returns

- 1 if the calling thread has won the election.
- 0 if the calling thread has lost the election.

### 29.22.5.12 starpu_omp_single_copyprivate()

```c
void starpu_omp_single_copyprivate (
    void (*)(void *arg, void *data, unsigned long long data_size) f,
    void *arg, void *data,
    unsigned long long data_size)
```

This function executes `f` on a single task of the current parallel region task, and then broadcast the contents of the memory block pointed by the copyprivate pointer `data` and of size `data_size` to the corresponding `data` pointed memory blocks of all the other participating region tasks. This function can be used to implement `#pragma omp single` with a copyprivate clause.

See also

- `starpu_omp_single_copyprivate_inline`
- `starpu_omp_single_copyprivate_inline_begin`
- `starpu_omp_single_copyprivate_inline_end`

### 29.22.5.13 starpu_omp_single_copyprivate_inline_begin()

```c
void * starpu_omp_single_copyprivate_inline_begin ( void * data )
```

This function elects one task among the tasks of the current parallel region task to execute the following single section, and then broadcast the copyprivate pointer `data` to all the other participating region tasks. This function can be used to implement `#pragma omp single` with a copyprivate clause without code outlining.

See also

- `starpu_omp_single_copyprivate_inline`
- `starpu_omp_single_copyprivate_inline_end`

### 29.22.5.14 starpu_omp_single_copyprivate_inline_end()

```c
void starpu_omp_single_copyprivate_inline_end ( void )
```

This function completes the execution of a single section and returns the broadcasted copyprivate pointer for tasks that lost the election and `NULL` for the task that won the election. This function can be used to implement `#pragma omp single` with a copyprivate clause without code outlining.

Returns

- the copyprivate pointer for tasks that lost the election and therefore did not execute the code of the single section.
- `NULL` for the task that won the election and executed the code of the single section.

See also

- `starpu_omp_single_copyprivate_inline`
- `starpu_omp_single_copyprivate_inline_begin`
29.22.5.15 starpu_omp_for()

```c
void starpu_omp_for (  
    void(*)(unsigned long long _first_i, unsigned long long _nb_i, void *arg) f,  
    void *arg,  
    unsigned long long nb_iterations,  
    unsigned long long chunk,  
    int schedule,  
    int ordered,  
    int nowait )
```

Executes a parallel loop together with the other threads participating to the innermost parallel region. `f` is the function to be executed iteratively. `arg` is an argument passed to function `f`. `nb_iterations` is the number of iterations to be performed by the parallel loop. `chunk` is the number of consecutive iterations that should be affected to the same thread when scheduling the loop workshares, it follows the semantics of the modifier argument in OpenMP `#pragma omp for` specification. `schedule` is the scheduling mode according to the OpenMP specification. `ordered` is a flag indicating whether the loop region may contain an ordered section (`ordered==1`) or not (`ordered==0`). `nowait` is a flag indicating whether an implicit barrier is requested after the for section (`nowait==0`) or not (`nowait==1`).

The function `f` will be called with arguments `_first_i`, the first iteration to perform, `_nb_i`, the number of consecutive iterations to perform before returning, `arg`, the free `arg` argument.

This function can be used to implement `#pragma omp for`.

29.22.5.16 starpu_omp_for_inline_first()

```c
int starpu_omp_for_inline_first (  
    unsigned long long nb_iterations,  
    unsigned long long chunk,  
    int schedule,  
    int ordered,  
    unsigned long long * _first_i,  
    unsigned long long * _nb_i  
)
```

Decides whether the current thread should start to execute a parallel loop section. See starpu_omp_for for the argument description.

This function together with starpu_omp_for_inline_next can be used to implement `#pragma omp for` without code outlining.

Returns

-1 if the calling thread participates to the loop region and should execute a first chunk of iterations. In that case, `_first_i` will be set to the first iteration of the chunk to perform and `_nb_i` will be set to the number of iterations of the chunk to perform.

0 if the calling thread does not participate to the loop region because all the available iterations have been affected to the other threads of the parallel region.

See also

starpu_omp_for

29.22.5.17 starpu_omp_for_inline_next()

```c
int starpu_omp_for_inline_next (  
    unsigned long long nb_iterations,  
    unsigned long long chunk,  
    int schedule,  
    int ordered,  
    unsigned long long * _first_i,  
    unsigned long long * _nb_i  
)
```

Decides whether the current thread should continue to execute a parallel loop section. See starpu_omp_for for the argument description.
This function together with `starpu_omp_for_inline_first` can be used to implement `#pragma omp for` without code outlining.

Returns

-1 if the calling thread should execute a next chunk of iterations. In that case, `_first_i` will be set to the first iteration of the chunk to perform and `_nb_i` will be set to the number of iterations of the chunk to perform.
0 if the calling thread does not participate anymore to the loop region because all the available iterations have been affected to the other threads of the parallel region.

See also

- `starpu_omp_for`

29.22.5.18 `starpu_omp_for_alt()`

```c
void starpu_omp_for_alt ( 
    void(*)(unsigned long long _begin_i, unsigned long long _end_i, void *arg) f, 
    void *arg, 
    unsigned long long nb_iterations, 
    unsigned long long chunk, 
    int schedule, 
    int ordered, 
    int nowait )
```

Alternative implementation of a parallel loop. This function differs from `starpu_omp_for` in the expected arguments of the loop function `f`.

- The function `f` will be called with arguments `_begin_i`, the first iteration to perform, `_end_i`, the first iteration not to perform before returning, `arg`, the free `arg` argument.

This function can be used to implement `#pragma omp for`.

See also

- `starpu_omp_for`

29.22.5.19 `starpu_omp_for_inline_first_alt()`

```c
int starpu_omp_for_inline_first_alt ( 
    unsigned long long nb_iterations, 
    unsigned long long chunk, 
    int schedule, 
    int ordered, 
    unsigned long long * _begin_i, 
    unsigned long long * _end_i )
```

Inline version of the alternative implementation of a parallel loop.

This function together with `starpu_omp_for_inline_next_alt` can be used to implement `#pragma omp for` without code outlining.

See also

- `starpu_omp_for`
- `starpu_omp_for_alt`
- `starpu_omp_for_inline_first`
29.22.5.20  `starpu_omp_for_inline_next_alt()`

```c
int starpu_omp_for_inline_next_alt (
    unsigned long long nb_iterations,
    unsigned long long chunk,
    int schedule,
    int ordered,
    unsigned long long * _begin_i,
    unsigned long long * _end_i )
```

Inline version of the alternative implementation of a parallel loop. This function together with `starpu_omp_for_inline_first_alt` can be used to implement `#pragma omp for` without code outlining.

See also
- `starpu_omp_for`
- `starpu_omp_for_alt`
- `starpu_omp_for_inline_next`

29.22.5.21  `starpu_omp_ordered()`

```c
void starpu_omp_ordered ( 
    void(*)(void *arg) f,
    void * arg )
```

Ensures that a function is sequentially executed once for each iteration in order within a parallel loop, by the thread that owns the iteration. `f` is the function to be executed by the thread that owns the current iteration. `arg` is an argument passed to function `f`. This function can be used to implement `#pragma omp ordered`.

29.22.5.22  `starpu_omp_ordered_inline_begin()`

```c
void starpu_omp_ordered_inline_begin ( 
    void )
```

Waits until all the iterations of a parallel loop below the iteration owned by the current thread have been executed. This function together with `starpu_omp_ordered_inline_end` can be used to implement `#pragma omp ordered` without code outlining.

29.22.5.23  `starpu_omp_ordered_inline_end()`

```c
void starpu_omp_ordered_inline_end ( 
    void )
```

Notifies that the ordered section for the current iteration has been completed. This function together with `starpu_omp_ordered_inline_begin` can be used to implement `#pragma omp ordered` without code outlining.

29.22.5.24  `starpu_omp_sections()`

```c
void starpu_omp_sections ( 
    unsigned long long nb_sections,
    void(**)(void *arg) section_f,
    void ** section_arg,
    int nowait )
```

Ensures that each function of a given array of functions is executed by one and only one thread. `nb_sections` is the number of functions in the array `section_f`. `section_f` is the array of functions to be executed as sections. `section_arg` is an array of arguments to be passed to the corresponding function. `nowait` is a flag indicating whether an implicit barrier is requested after the execution of all the sections (`nowait==0`) or not (`nowait==!0`). This function can be used to implement `#pragma omp sections` and `#pragma omp section`. 

Generated by Doxygen
29.22 OpenMP Runtime Support

29.22.5.25 starpu_omp_sections_combined()

```c
void starpu_omp_sections_combined (  
    unsigned long long nb_sections,  
    void(*)(unsigned long long section_num, void *arg) section_f,  
    void * section_arg,  
    int nowait )
```

Alternative implementation of sections. This function differs from `starpu_omp_sections` in that all the sections are combined within a single function in this version. `section_f` is the function implementing the combined sections. The function `section_f` will be called with arguments `section_num`, the section number to be executed, `arg`, the entry of `section_arg` corresponding to this section. This function can be used to implement `#pragma omp sections` and `#pragma omp section`. See also `starpu_omp_sections`.

29.22.5.26 starpu_omp_task_region()

```c
void starpu_omp_task_region (  
    const struct starpu_omp_task_region_attr * attr )
```

Generates an explicit child task. The execution of the generated task is asynchronous with respect to the calling code unless specified otherwise. `attr` specifies the attributes for the generated task region. This function can be used to implement `#pragma omp task`.

29.22.5.27 starpu_omp_taskwait()

```c
void starpu_omp_taskwait (  
    void )
```

Waits for the completion of the tasks generated by the current task. This function does not wait for the descendants of the tasks generated by the current task. This function can be used to implement `#pragma omp taskwait`.

29.22.5.28 starpu_omp_taskgroup()

```c
void starpu_omp_taskgroup (  
    void(*)(void *arg) f,  
    void * arg )
```

Launches a function and wait for the completion of every descendant task generated during the execution of the function. This function can be used to implement `#pragma omp taskgroup`. See also `starpu_omp_taskgroup Inline Begin`, `starpu_omp_taskgroup Inline End`.

29.22.5.29 starpu_omp_taskgroup Inline Begin()

```c
void starpu_omp_taskgroup Inline Begin (  
    void )
```

Launches a function and gets ready to wait for the completion of every descendant task generated during the dynamic scope of the taskgroup. This function can be used to implement `#pragma omp taskgroup without code outlining`. See also `starpu_omp_taskgroup`, `starpu_omp_taskgroup Inline End`.
29.22.5.30 starpu_omp_taskgroup_inline_end()

```c
void starpu_omp_taskgroup_inline_end (  
    void  
)
```

Waits for the completion of every descendant task generated during the dynamic scope of the taskgroup. This function can be used to implement `#pragma omp taskgroup` without code outlining.

See also

- `starpu_omp_taskgroup`
- `starpu_omp_taskgroup_inline_begin`

29.22.5.31 starpu_omp_set_num_threads()

```c
void starpu_omp_set_num_threads (  
    int threads  
)
```

This function sets ICVS `nthreads_var` for the parallel regions to be created with the current region. Note: The StarPU OpenMP runtime support currently ignores this setting for nested parallel regions.

See also

- `starpu_omp_get_num_threads`
- `starpu_omp_get_thread_num`
- `starpu_omp_get_max_threads`
- `starpu_omp_get_num_procs`

29.22.5.32 starpu_omp_get_num_threads()

```c
int starpu_omp_get_num_threads ( )
```

This function returns the number of threads of the current region.

Returns

the number of threads of the current region.

See also

- `starpu_omp_set_num_threads`
- `starpu_omp_get_thread_num`
- `starpu_omp_get_max_threads`
- `starpu_omp_get_num_procs`

29.22.5.33 starpu_omp_get_thread_num()

```c
int starpu_omp_get_thread_num ( )
```

This function returns the rank of the current thread among the threads of the current region.

Returns

the rank of the current thread in the current region.

See also

- `starpu_omp_set_num_threads`
- `starpu_omp_get_num_threads`
- `starpu_omp_get_max_threads`
- `starpu_omp_get_num_procs`
29.22.5.34  starpu_omp_get_max_threads()

```c
int starpu_omp_get_max_threads ( )
```

This function returns the maximum number of threads that can be used to create a region from the current region.

Returns

the maximum number of threads that can be used to create a region from the current region.

See also

starpu_omp_set_num_threads
starpu_omp_get_num_threads
starpu_omp_get_thread_num
starpu_omp_get_num_procs

29.22.5.35  starpu_omp_get_num_procs()

```c
int starpu_omp_get_num_procs ( )
```

This function returns the number of StarPU CPU workers.

Returns

the number of StarPU CPU workers.

See also

starpu_omp_set_num_threads
starpu_omp_get_num_threads
starpu_omp_get_thread_num
starpu_omp_get_max_threads

29.22.5.36  starpu_omp_in_parallel()

```c
int starpu_omp_in_parallel ( )
```

This function returns whether it is called from the scope of a parallel region or not.

Returns

!0 if called from a parallel region scope.
0 otherwise.

29.22.5.37  starpu_omp_set_dynamic()

```c
void starpu_omp_set_dynamic ( int dynamic_threads )
```

This function enables (1) or disables (0) dynamically adjusting the number of parallel threads. Note: The StarPU OpenMP runtime support currently ignores the argument of this function.

See also

starpu_omp_get_dynamic
29.22.5.38 starpu_omp_get_dynamic()

int starpu_omp_get_dynamic ( void )

This function returns the state of dynamic thread number adjustment.

Returns

1 if dynamic thread number adjustment is enabled.
0 otherwise.

See also

starpu_omp_set_dynamic

29.22.5.39 starpu_omp_set_nested()

void starpu_omp_set_nested ( int nested )

This function enables (1) or disables (0) nested parallel regions.

Note: The StarPU OpenMP runtime support currently ignores the argument of this function.

See also

starpu_omp_get_nested
starpu_omp_get_max_active_levels
starpu_omp_set_max_active_levels
starpu_omp_get_level
starpu_omp_get_active_level

29.22.5.40 starpu_omp_get_nested()

int starpu_omp_get_nested ( void )

This function returns whether nested parallel sections are enabled or not.

Returns

1 if nested parallel sections are enabled.
0 otherwise.

See also

starpu_omp_set_nested
starpu_omp_get_max_active_levels
starpu_omp_set_max_active_levels
starpu_omp_get_level
starpu_omp_get_active_level

29.22.5.41 starpu_omp_get_cancellation()

int starpu_omp_get_cancellation ( void )

This function returns the state of the cancel ICVS var.
29.22.5.42 starpu_omp_set_schedule()

```c
void starpu_omp_set_schedule (enum starpu_omp_sched_value kind, int modifier)
```

This function sets the default scheduling kind for upcoming loops within the current parallel section. `kind` is the scheduler kind, `modifier` complements the scheduler kind with informations such as the chunk size, in accordance with the OpenMP specification.

See also

- `starpu_omp_get_schedule`

29.22.5.43 starpu_omp_get_schedule()

```c
void starpu_omp_get_schedule (enum starpu_omp_sched_value *kind, int *modifier)
```

This function returns the current selected default loop scheduler.

Returns

- the kind and the modifier of the current default loop scheduler.

See also

- `starpu_omp_set_schedule`

29.22.5.44 starpu_omp_get_thread_limit()

```c
int starpu_omp_get_thread_limit (void)
```

This function returns the number of StarPU CPU workers.

Returns

- the number of StarPU CPU workers.

29.22.5.45 starpu_omp_set_max_active_levels()

```c
void starpu_omp_set_max_active_levels (int max_levels)
```

This function sets the maximum number of allowed active parallel section levels. Note: The StarPU OpenMP runtime support currently ignores the argument of this function and assume `max_levels` equals 1 instead.

See also

- `starpu_omp_set_nested`
- `starpu_omp_get_nested`
- `starpu_omp_get_max_active_levels`
- `starpu_omp_get_level`
- `starpu_omp_get_active_level`
29.22.5.46  starpu_omp_get_max_active_levels()

int starpu_omp_get_max_active_levels (
    void )

This function returns the current maximum number of allowed active parallel section levels.

Returns

the current maximum number of allowed active parallel section levels.

See also

starpu_omp_set_nested
starpu_omp_get_nested
starpu_omp_set_max_active_levels
starpu_omp_get_level
starpu_omp_get_active_level

29.22.5.47  starpu_omp_get_level()

int starpu_omp_get_level ( 
    void )

This function returns the nesting level of the current parallel section.

Returns

the nesting level of the current parallel section.

See also

starpu_omp_set_nested
starpu_omp_get_nested
starpu_omp_get_max_active_levels
starpu_omp_set_max_active_levels
starpu_omp_get_active_level

29.22.5.48  starpu_omp_get_ancestor_thread_num()

int starpu_omp_get_ancestor_thread_num ( 
    int level )

This function returns the number of the ancestor of the current parallel section.

Returns

the number of the ancestor of the current parallel section.

29.22.5.49  starpu_omp_get_team_size()

int starpu_omp_get_team_size ( 
    int level )

This function returns the size of the team of the current parallel section.

Returns

the size of the team of the current parallel section.
29.22.5.50  starpu_omp_get_active_level()

int starpu_omp_get_active_level ( void )

This function returns the nestinglevel of the current innermost active parallel section.

Returns
  the nestinglevel of the current innermost active parallel section.

See also
  starpu_omp_set_nested
  starpu_omp_get_nested
  starpu_omp_get_max_active_levels
  starpu_omp_set_max_active_levels
  starpu_omp_get_level

29.22.5.51  starpu_omp_in_final()

int starpu_omp_in_final ( void )

This function checks whether the current task is final or not.

Returns
  !0 if called from a final task.
  0 otherwise.

29.22.5.52  starpu_omp_get_proc_bind()

enum starpu_omp_proc_bind_value starpu_omp_get_proc_bind ( void )

This function returns the proc_bind setting of the current parallel region.

Returns
  the proc_bind setting of the current parallel region.

29.22.5.53  starpu_omp_set_default_device()

void starpu_omp_set_default_device ( int device_num )

This function sets the number of the device to use as default.
Note: The StarPU OpenMP runtime support currently ignores the argument of this function.

See also
  starpu_omp_get_default_device
  starpu_omp_is_initial_device

29.22.5.54  starpu_omp_get_default_device()

int starpu_omp_get_default_device ( void )

This function returns the number of the device used as default.
Returns

the number of the device used as default.

See also

starpu_omp_set_default_device
starpu_omp_is_initial_device

29.22.5.55  starpu_omp_get_num_devices()

int starpu_omp_get_num_devices (   
    void   )
This function returns the number of the devices.

Returns

the number of the devices.

29.22.5.56  starpu_omp_get_num_teams()

int starpu_omp_get_num_teams (   
    void   )
This function returns the number of teams in the current teams region.

Returns

the number of teams in the current teams region.

See also

starpu_omp_get_num_teams

29.22.5.57  starpu_omp_get_team_num()

int starpu_omp_get_team_num (   
    void   )
This function returns the team number of the calling thread.

Returns

the team number of the calling thread.

See also

starpu_omp_get_num_teams

29.22.5.58  starpu_omp_is_initial_device()

int starpu_omp_is_initial_device (   
    void   )
This function checks whether the current device is the initial device or not.
29.22.5.59 starpu_omp_get_max_task_priority()

```c
int starpu_omp_get_max_task_priority (void)
```

The `omp_get_max_task_priority` routine returns the maximum value that can be specified in the priority clause.

Returns

- `-1` if called from the host device.
- `0` otherwise.

See also

- `starpu_omp_set_default_device`
- `starpu_omp_get_default_device`

29.22.5.60 starpu_omp_init_lock()

```c
void starpu_omp_init_lock (starpu_omp_lock_t * lock)
```

This function initializes an opaque lock object.

See also

- `starpu_omp_destroy_lock`
- `starpu_omp_set_lock`
- `starpu_omp_unset_lock`
- `starpu_omp_test_lock`

29.22.5.61 starpu_omp_destroy_lock()

```c
void starpu_omp_destroy_lock (starpu_omp_lock_t * lock)
```

This function destroys an opaque lock object.

See also

- `starpu_omp_init_lock`
- `starpu_omp_set_lock`
- `starpu_omp_unset_lock`
- `starpu_omp_test_lock`

29.22.5.62 starpu_omp_set_lock()

```c
void starpu_omp_set_lock (starpu_omp_lock_t * lock)
```

This function locks an opaque lock object. If the lock is already locked, the function will block until it succeeds in exclusively acquiring the lock.

See also

- `starpu_omp_init_lock`
- `starpu_omp_destroy_lock`
- `starpu_omp_unset_lock`
- `starpu_omp_test_lock`
29.22.5.63 starpu_omp_unset_lock()

void starpu_omp_unset_lock ( 
    starpu_omp_lock_t * lock )

This function unlocks a previously locked lock object. The behaviour of this function is unspecified if it is called on an unlocked lock object.

See also
  starpu_omp_init_lock
  starpu_omp_destroy_lock
  starpu_omp_set_lock
  starpu_omp_test_lock

29.22.5.64 starpu_omp_test_lock()

int starpu_omp_test_lock ( 
    starpu_omp_lock_t * lock )

This function unblockingly attempts to lock a lock object and returns whether it succeeded or not.

Returns
  !0 if the function succeeded in acquiring the lock.
  0 if the lock was already locked.

See also
  starpu_omp_init_lock
  starpu_omp_destroy_lock
  starpu_omp_set_lock
  starpu_omp_unset_lock

29.22.5.65 starpu_omp_init_nest_lock()

void starpu_omp_init_nest_lock ( 
    starpu_omp_nest_lock_t * lock )

This function initializes an opaque lock object supporting nested locking operations.

See also
  starpu_omp_destroy_nest_lock
  starpu_omp_set_nest_lock
  starpu_omp_unset_nest_lock
  starpu_omp_test_nest_lock

29.22.5.66 starpu_omp_destroy_nest_lock()

void starpu_omp_destroy_nest_lock ( 
    starpu_omp_nest_lock_t * lock )

This function destroys an opaque lock object supporting nested locking operations.

See also
  starpu_omp_init_nest_lock
  starpu_omp_set_nest_lock
  starpu_omp_unset_nest_lock
  starpu_omp_test_nest_lock
29.22.5.67 starpu_omp_set_nest_lock()

```c
void starpu_omp_set_nest_lock ( 
    starpu_omp_nest_lock_t * lock )
```

This function locks an opaque lock object supporting nested locking operations. If the lock is already locked by another task, the function will block until it succeeds in exclusively acquiring the lock. If the lock is already taken by the current task, the function will increase the nested locking level of the lock object.

See also

- starpu_omp_init_nest_lock
- starpu_omp_destroy_nest_lock
- starpu_omp_unset_nest_lock
- starpu_omp_test_nest_lock

29.22.5.68 starpu_omp_unset_nest_lock()

```c
void starpu_omp_unset_nest_lock ( 
    starpu_omp_nest_lock_t * lock )
```

This function unlocks a previously locked lock object supporting nested locking operations. If the lock has been locked multiple times in nested fashion, the nested locking level is decreased and the lock remains locked. Otherwise, if the lock has only been locked once, it becomes unlocked. The behaviour of this function is unspecified if it is called on an unlocked lock object. The behaviour of this function is unspecified if it is called from a different task than the one that locked the lock object.

See also

- starpu_omp_init_nest_lock
- starpu_omp_destroy_nest_lock
- starpu_omp_set_nest_lock
- starpu_omp_test_nest_lock

29.22.5.69 starpu_omp_test_nest_lock()

```c
int starpu_omp_test_nest_lock ( 
    starpu_omp_nest_lock_t * lock )
```

This function unblocking attempts to lock an opaque lock object supporting nested locking operations and returns whether it succeeded or not. If the lock is already locked by another task, the function will return without having acquired the lock. If the lock is already taken by the current task, the function will increase the nested locking level of the lock object.

Returns

- 1 if the function succeeded in acquiring the lock.
- 0 if the lock was already locked.

See also

- starpu_omp_init_nest_lock
- starpu_omp_destroy_nest_lock
- starpu_omp_set_nest_lock
- starpu_omp_unset_nest_lock

29.22.5.70 starpu_omp_atomic_fallback_inline_begin()

```c
void starpu_omp_atomic_fallback_inline_begin ( 
    void )
```

This function implements the entry point of a fallback global atomic region. It blocks until it succeeds in acquiring exclusive access to the global atomic region.
See also

```
starpu_omp_atomic_fallback_inline_end
```

### 29.22.5.71 starpu_omp_atomic_fallback_inline_end()

```c
void starpu_omp_atomic_fallback_inline_end ( void )
```

This function implements the exit point of a fallback global atomic region. It releases the exclusive access to the global atomic region.

See also

```
starpu_omp_atomic_fallback_inline_begin
```

### 29.22.5.72 starpu_omp_get_wtime()

```c
double starpu_omp_get_wtime ( void )
```

This function returns the elapsed wallclock time in seconds.

Returns

the elapsed wallclock time in seconds.

See also

```
starpu_omp_get_wtick
```

### 29.22.5.73 starpu_omp_get_wtick()

```c
double starpu_omp_get_wtick ( void )
```

This function returns the precision of the time used by `starpu_omp_get_wtime`.

Returns

the precision of the time used by `starpu_omp_get_wtime`.

See also

```
starpu_omp_get_wtime
```

### 29.22.5.74 starpu_omp_vector_annotate()

```c
void starpu_omp_vector_annotate ( starpu_data_handle_t handle,
                                  uint32_t slice_base )
```

This function enables setting additional vector metadata needed by the OpenMP Runtime Support. 

*handle* is vector data handle. *slice_base* is the base of an array slice, expressed in number of vector elements from the array base.

See also

```
STARPU_VECTOR_GET_SLICE_BASE
```
29.23 MIC Extensions

Macros

- `#define STARPU_USE_MIC`
- `#define STARPU_MAXMICDEVS`

Typedefs

- `typedef void * starpu_mic_func_symbol_t`

Functions

- `int starpu_mic_register_kernel (starpu_mic_func_symbol_t *symbol, const char *func_name)`
- `starpu_mic_kernel_t starpu_mic_get_kernel (starpu_mic_func_symbol_t symbol)`

29.23.1 Detailed Description

29.23.2 Macro Definition Documentation

29.23.2.1 STARPU_USE_MIC

`#define STARPU_USE_MIC`

Defined when StarPU has been installed with MIC support. It should be used in your code to detect the availability of MIC.

29.23.2.2 STARPU_MAXMICDEVS

`#define STARPU_MAXMICDEVS`

Define the maximum number of MIC devices that are supported by StarPU.

29.23.3 Typedef Documentation

29.23.3.1 starpu_mic_func_symbol_t

`starpu_mic_func_symbol_t`

Type for MIC function symbols

29.23.4 Function Documentation

29.23.4.1 starpu_mic_register_kernel()

`int starpu_mic_register_kernel ( starpu_mic_func_symbol_t * symbol,   const char * func_name )`

Initiate a lookup on each MIC device to find the address of the function named `func_name`, store it in the global array kernels and return the index in the array through `symbol`.

29.23.4.2 starpu_mic_get_kernel()

`starpu_mic_kernel_t starpu_mic_get_kernel ( starpu_mic_func_symbol_t symbol )`

If successful, return the pointer to the function defined by `symbol` on the device linked to the called device. This can for instance be used in a `starpu_mic_func_t` implementation.
29.24 SCC Extensions

Macros

• #define STARPU_USE_SCC
• #define STARPU_MAXSCCDEVS

Typedefs

• typedef void *starpu_scc_func_symbol_t

Functions

• int starpu_scc_register_kernel (starpu_scc_func_symbol_t *symbol, const char *func_name)
• starpu_scc_kernel_t starpu_scc_get_kernel (starpu_scc_func_symbol_t symbol)

29.24.1 Detailed Description

29.24.2 Macro Definition Documentation

29.24.2.1 STARPU_USE_SCC

#define STARPU_USE_SCC
Defined when StarPU has been installed with SCC support. It should be used in your code to detect the availability of SCC.

29.24.2.2 STARPU_MAXSCCDEVS

#define STARPU_MAXSCCDEVS
Define the maximum number of SCC devices that are supported by StarPU.

29.24.3 Typedef Documentation

29.24.3.1 starpu_scc_func_symbol_t

starpu_scc_func_symbol_t
Type for SCC function symbols

29.24.4 Function Documentation

29.24.4.1 starpu_scc_register_kernel()

int starpu_scc_register_kernel (  
    starpu_scc_func_symbol_t *symbol,  
    const char *func_name )
Initiate a lookup on each SCC device to find the address of the function named func_name, store them in the global array kernels and return the index in the array through symbol.

29.24.4.2 starpu_scc_get_kernel()

starpu_scc_kernel_t starpu_scc_get_kernel (  
    starpu_scc_func_symbol_t symbol )
If success, return the pointer to the function defined by symbol on the device linked to the called device. This can for instance be used in a starpu_scc_func_symbol_t implementation.
29.25 Miscellaneous Helpers

Functions

- `int starpu_data_cpy (starpu_data_handle_t dst_handle, starpu_data_handle_t src_handle, int asynchronous, void(*callback_func)(void *), void *callback_arg)`
  
  Copy the content of `src_handle` into `dst_handle`. The parameter `asynchronous` indicates whether the function should block or not. In the case of an asynchronous call, it is possible to synchronize with the termination of this operation either by the means of implicit dependencies (if enabled) or by calling `starpu_task_wait_for_all()`. If `callback_func` is not `NULL`, this callback function is executed after the handle has been copied, and it is given the pointer `callback_arg` as argument.

- `void starpu_execute_on_each_worker (void(*)(void *), void *arg, uint32_t where)`

  Execute the given function `func` on a subset of workers. When calling this method, the offloaded function `func` is executed by every StarPU worker that are eligible to execute the function. The argument `arg` is passed to the offloaded function. The argument `where` specifies on which types of processing units the function should be executed. Similarly to the field `starpu_codelet::where`, it is possible to specify that the function should be executed on every CUDA device and every CPU by passing `STARPU_CPU|STARPU_CUDA`. This function blocks until `func` has been executed on every appropriate processing units, and thus may not be called from a callback function for instance.

- `void starpu_execute_on_each_worker_ex (void(*)(void *), void *arg, uint32_t where, const char *name)`

  Same as `starpu_execute_on_each_worker()`, except that the task name is specified in the argument `name`.

- `void starpu_execute_on_specific_workers (void(*)(void *), void *arg, unsigned num_workers, unsigned *workers, const char *name)`

- `double starpu_timing_now (void)`
void * arg,
unsigned num_workers,
unsigned * workers,
const char * name )

Call func(arg) on every worker in the workers array. num_workers indicates the number of workers in this array. This function is synchronous, but the different workers may execute the function in parallel.

29.25.2.5 starpu_timing_now()

double starpu_timing_now ( 
    void  )

Return the current date in micro-seconds.

29.26 FxT Support

Data Structures

### 29.26.3 Function Documentation

#### 29.26.3.1 starpu_fxt_options_init()

```c
void starpu_fxt_options_init ( 
    struct starpu_fxt_options * options )

todo
```

Generated by Doxygen
29.26.3.2 starpu_fxt_generate_trace()

```c
void starpu_fxt_generate_trace (  
    struct starpu_fxt_options * options  )  
```

todo

29.26.3.3 starpu_fxt_start_profiling()

```c
void starpu_fxt_start_profiling (  
                                 )  
```

Start recording the trace. The trace is by default started from starpu_init() call, but can be paused by using starpu_fxt_stop_profiling(), in which case starpu_fxt_start_profiling() should be called to resume recording events.

29.26.3.4 starpu_fxt_stop_profiling()

```c
void starpu_fxt_stop_profiling (  
                                   )  
```

Stop recording the trace. The trace is by default stopped when calling starpu_shutdown(). starpu_fxt_stop_profiling() can however be used to stop it earlier. starpu_fxt_start_profiling() can then be called to start recording it again, etc.

29.26.3.5 starpu_fxt_autostart_profiling()

```c
void starpu_fxt_autostart_profiling (  
                                       int autostart  )  
```

Determine whether profiling should be started by starpu_init(), or only when starpu_fxt_start_profiling() is called. autostart should be 1 to do so, or 0 to prevent it.

29.26.3.6 starpu_fxt_write_data_trace()

```c
void starpu_fxt_write_data_trace (  
                                          char * filename_in  )  
```

todo

29.26.3.7 starpu_fxt_trace_user_event()

```c
void starpu_fxt_trace_user_event (  
                                         unsigned long code  )  
```

Add an event in the execution trace if FxT is enabled.

29.26.3.8 starpu_fxt_trace_user_event_string()

```c
void starpu_fxt_trace_user_event_string (  
                                                   const char * s  )  
```

Add a string event in the execution trace if FxT is enabled.

29.27 FFT Support

Functions

- void * starpufft_malloc (size_t n)
- void starpufft_free (void *p)
- starpufft_plan starpufft_plan_dft_1d (int n, int sign, unsigned flags)
- starpufft_plan starpufft_plan_dft_2d (int n, int m, int sign, unsigned flags)
- struct starpu_task * starpufft_start (starpufft_plan p, void *in, void *out)
- struct starpu_task * starpufft_start_handle (starpufft_plan p, starpu_data_handle_t in, starpu_data_handle_t out)
- int starpufft_execute (starpufft_plan p, void *in, void *out)
- int starpufft_execute_handle (starpufft_plan p, starpu_data_handle_t in, starpu_data_handle_t out)
29.27 FFT Support

- void starpuff_cleanup (starpuff_plan p)
- void starpuff_destroy_plan (starpuff_plan p)

29.27.1 Detailed Description

29.27.2 Function Documentation

29.27.2.1 starpuff_malloc()

```c
void * starpuff_malloc (size_t n )
```

Allocate memory for n bytes. This is preferred over malloc(), since it allocates pinned memory, which allows overlapped transfers.

29.27.2.2 starpuff_free()

```c
void * starpuff_free ( void * p )
```

Release memory previously allocated.

29.27.2.3 starpuff_plan_dft_1d()

```c
struct starpuff_plan * starpuff_plan_dft_1d (int n, int sign, unsigned flags )
```

Initialize a plan for 1D FFT of size n. sign can be STARPUFFT_FORWARD or STARPUFFT_INVERSE. flags must be 0.

29.27.2.4 starpuff_plan_dft_2d()

```c
struct starpuff_plan * starpuff_plan_dft_2d (int n, int m, int sign, unsigned flags )
```

Initialize a plan for 2D FFT of size (n, m). sign can be STARPUFFT_FORWARD or STARPUFFT_INVERSE. flags must be 0.

29.27.2.5 starpuff_start()

```c
struct starpu_task * starpuff_start (starpuff_plan p, void * in, void * out )
```

Start an FFT previously planned as p, using in and out as input and output. This only submits the task and does not wait for it. The application should call starpuff_cleanup() to unregister the

29.27.2.6 starpuff_start_handle()

```c
struct starpu_task * starpuff_start_handle (starpuff_plan p, starpu_data_handle_t in, starpu_data_handle_t out )
```

Start an FFT previously planned as p, using data handles in and out as input and output (assumed to be vectors of elements of the expected types). This only submits the task and does not wait for it.
29.27.7 starpufft_execute()

```c
void starpufft_execute ( 
    starpufft_plan p, 
    void * in, 
    void * out )
```

Execute an FFT previously planned as `p`, using `in` and `out` as input and output. This submits and waits for the task.

29.27.8 starpufft_execute_handle()

```c
void starpufft_execute_handle ( 
    starpufft_plan p, 
    starpu_data_handle_t in, 
    starpu_data_handle_t out )
```

Execute an FFT previously planned as `p`, using data handles `in` and `out` as input and output (assumed to be vectors of elements of the expected types). This submits and waits for the task.

29.27.9 starpufft_cleanup()

```c
void starpufft_cleanup ( 
    starpufft_plan p )
```

Release data for plan `p`, in the `starpufft_start()` case.

29.27.10 starpufft_destroy_plan()

```c
void starpufft_destroy_plan ( 
    starpufft_plan p )
```

Destroy plan `p`, i.e. release all CPU (fftw) and GPU (cufft) resources.

### 29.28 MPI Support

#### Initialisation

- `#define STARPU_USE_MPI`
- `int starpu_mpi_init_comm (int *argc, char ***argv, int initialize_mpi, MPI_Comm comm)`
- `int starpu_mpi_init (int *argc, char ***argv, int initialize_mpi)`
- `int starpu_mpi_init_with_driver (int *argc, char ***argv, int initialize_mpi, struct starpu_conf *conf)`
- `int starpu_mpi_initialize (void)`
- `int starpu_mpi_initialize_extended (int *rank, int *world_size)`
- `void starpu_mpi_shutdown (void)`
- `void starpu_mpi_comm_amounts_retrieve (size_t *comm_amounts)`
- `int starpu_mpi_comm_size (MPI_Comm comm, int *size)`
- `int starpu_mpi_comm_rank (MPI_Comm comm, int *rank)`
- `int starpu_mpi_world_rank (void)`
- `int starpu_mpi_world_size (void)`

#### Communication

- `#define STARPU_MPI_TAG_UB`
- `int starpu_mpi_send (starpu_data_handle_t data_handle, int dest, starpu_mpi_tag_t data_tag, MPI_Comm comm)`
- `int starpu_mpi_send_prio (starpu_data_handle_t data_handle, int dest, starpu_mpi_tag_t data_tag, int prio, MPI_Comm comm)`
- `int starpu_mpi_recv (starpu_data_handle_t data_handle, int source, starpu_mpi_tag_t data_tag, MPI_Comm comm, MPI_Status *status)`
- `int starpu_mpi_isend (starpu_data_handle_t data_handle, starpu_mpi_req *req, int dest, starpu_mpi_tag_t data_tag, MPI_Comm comm)`

MPI Master Slave

- `#define STARPU_USE_MPI_MASTER_SLAVE`

29.28.1 Detailed Description

29.28.2 Macro Definition Documentation
29.28.2.1 STARPU_USE_MPI

#define STARPU_USE_MPI
Defined when StarPU has been installed with MPI support. It should be used in your code to detect the availability of MPI.

29.28.2.2 STARPU_MPI_TAG_UB

#define STARPU_MPI_TAG_UB
When given to the function `starpu_mpi_comm_get_attr()`, retrieve the value for the upper bound for tag value.

29.28.2.3 starpu_mpi_data_register

#define starpu_mpi_data_register(
  data_handle,
  data_tag,
  rank )
Register to MPI a StarPU data handle with the given tag, rank and the MPI communicator `MPI_COMM_WORLD`. It also automatically clears the MPI communication cache when unregistering the data.

29.28.2.4 starpu_data_set_tag

#define starpu_data_set_tag
Symbol kept for backward compatibility. Calling function `starpu_mpi_data_set_tag()`

29.28.2.5 starpu_mpi_data_set_rank

#define starpu_mpi_data_set_rank(
  handle,
  rank )
Register to MPI a StarPU data handle with the given rank and the MPI communicator `MPI_COMM_WORLD`. No tag will be defined. It also automatically clears the MPI communication cache when unregistering the data. Symbol kept for backward compatibility. Calling function `starpu_mpi_data_set_rank()`

29.28.2.6 starpu_data_set_rank

#define starpu_data_set_rank
Register to MPI a StarPU data handle with the given rank and the MPI communicator `MPI_COMM_WORLD`. No tag will be defined. It also automatically clears the MPI communication cache when unregistering the data. Symbol kept for backward compatibility. Calling function `starpu_mpi_data_set_rank()`

29.28.2.7 starpu_data_get_rank

#define starpu_data_get_rank
Return the rank of the given data. Symbol kept for backward compatibility. Calling function `starpu_mpi_data_get_rank()`

29.28.2.8 starpu_data_get_tag

#define starpu_data_get_tag
Return the tag of the given data. Symbol kept for backward compatibility. Calling function `starpu_mpi_data_get_tag()`

29.28.2.9 STARPU_MPI_PER_NODE

#define STARPU_MPI_PER_NODE
Can be used as rank when calling `starpu_mpi_data_register()` and alike, to specify that the data is per-node: each node will have its own value. Tasks writing to such data will be replicated on all nodes (and all parameters then have to be per-node). Tasks not writing to such data will just take the node-local value without any MPI communication.
29.28.2.10  \texttt{STARPU\_EXECUTE\_ON\_NODE}

\texttt{#define \texttt{STARPU\_EXECUTE\_ON\_NODE}}
Used when calling \texttt{starpu\_mpi\_task\_insert()}, must be followed by an integer value which specified the node on which to execute the codelet.

29.28.2.11  \texttt{STARPU\_EXECUTE\_ON\_DATA}

\texttt{#define \texttt{STARPU\_EXECUTE\_ON\_DATA}}
Used when calling \texttt{starpu\_mpi\_task\_insert()}, must be followed by a data handle to specify that the node owning the given data will execute the codelet.

29.28.2.12  \texttt{STARPU\_NODE\_SELECTION\_POLICY}

\texttt{#define \texttt{STARPU\_NODE\_SELECTION\_POLICY}}
Used when calling \texttt{starpu\_mpi\_task\_insert()}, must be followed by a identifier to a node selection policy. This is needed when several nodes own data in \texttt{STARPU\_W} mode.

29.28.2.13  \texttt{STARPU\_MPI\_NODE\_SELECTION\_CURRENT\_POLICY}

\texttt{#define \texttt{STARPU\_MPI\_NODE\_SELECTION\_CURRENT\_POLICY}}
todo

29.28.2.14  \texttt{STARPU\_MPI\_NODE\_SELECTION\_MOST\_R\_DATA}

\texttt{#define \texttt{STARPU\_MPI\_NODE\_SELECTION\_MOST\_R\_DATA}}
todo

29.28.2.15  \texttt{STARPU\_USE\_MPI\_MASTER\_SLAVE}

\texttt{#define \texttt{STARPU\_USE\_MPI\_MASTER\_SLAVE}}
Defined when StarPU has been installed with MPI Master Slave support. It should be used in your code to detect the availability of MPI Master Slave.

29.28.3  Function Documentation

29.28.3.1  \texttt{starpu\_mpi\_init\_comm()}

\texttt{int \texttt{starpu\_mpi\_init\_comm (}}
\texttt{    int \_\_argc,}
\texttt{    char \_\_argv[\_\_argc],}
\texttt{    int \texttt{initialize\_mpi,}}
\texttt{    MPI\_Comm \_\_comm )}}
Initialize the starpumpi library with the given communicator \texttt{\_\_comm}. \texttt{\_\_initialize\_mpi} indicates if MPI should be initialized or not by StarPU. If the value is not 0, MPI will be initialized by calling \texttt{MPI\_Init\_Thread(\_\_argc, \_\_argv, MPI\_THREAD\_SERIALIZED, \ldots). \texttt{starpu\_init()} must be called before \texttt{starpu\_mpi\_init\_comm()}}.

29.28.3.2  \texttt{starpu\_mpi\_init()}

\texttt{int \texttt{starpu\_mpi\_init (}}
\texttt{    int \_\_argc,}
\texttt{    char \_\_argv[\_\_argc],}
\texttt{    int \texttt{initialize\_mpi } )}}
Call \texttt{\texttt{starpu\_mpi\_init\_comm()}} with the MPI communicator \texttt{MPI\_COMM\_WORLD}. 

Generated by Doxygen
29.28.3.3 starpu_mpi_init_with_driver()

```c
int starpu_mpi_init_with_driver ( 
    int * argc, 
    char *** argv, 
    int initialize_mpi, 
    struct starpu_conf * conf )
```

Call `starpu_mpi_init_comm()` with the MPI communicator MPI_COMM_WORLD, and keeps the CPU driver 0 for the MPI thread. This driver will be run and so execute tasks some times when the MPI thread has no requests to handle. `starpu_mpi_init_with_driver()` also calls `starpu_init()` internally.

29.28.3.4 starpu_mpi_initialize()

```c
int starpu_mpi_initialize ( 
    void )
```

**Deprecated** This function has been made deprecated. One should use instead the function `starpu_mpi_init()`. This function does not call `MPI_Init()`, it should be called beforehand.

29.28.3.5 starpu_mpi_initialize_extended()

```c
int starpu_mpi_initialize_extended ( 
    int * rank, 
    int * world_size )
```

**Deprecated** This function has been made deprecated. One should use instead the function `starpu_mpi_init()`. MPI will be initialized by starpumpi by calling `MPI_Init_Thread(argc, argv, MPI_THREAD_SERIALIZE, ...)`.

29.28.3.6 starpu_mpi_shutdown()

```c
int starpu_mpi_shutdown ( 
    void )
```

Clean the starpumpi library. This must be called between calling `starpu_mpi` functions and `starpu_shutdown()`. `MPI_Finalize()` will be called if StarPU-MPI has been initialized by `starpu_mpi_init()`.

29.28.3.7 starpu_mpi_comm_amounts_retrieve()

```c
void starpu_mpi_comm_amounts_retrieve ( 
    size_t * comm_amounts )
```

Retrieve the current amount of communications from the current node in the array `comm_amounts` which must have a size greater or equal to the world size. Communications statistics must be enabled (see `STARPU_COMM_M_STATS`).

29.28.3.8 starpu_mpi_comm_size()

```c
int starpu_mpi_comm_size ( 
    MPI_Comm comm, 
    int * size )
```

Return in `size` the size of the communicator `comm`.

29.28.3.9 starpu_mpi_comm_rank()

```c
int starpu_mpi_comm_rank ( 
    MPI_Comm comm, 
    int * rank )
```

Return in `rank` the rank of the calling process in the communicator `comm`.

Generated by Doxygen
29.28.3.10 starpu_mpi_world_rank()

```c
int starpu_mpi_world_rank ( void )
```

Return the rank of the calling process in the communicator `MPI_COMM_WORLD`

29.28.3.11 starpu_mpi_world_size()

```c
int starpu_mpi_world_size ( void )
```

Return the size of the communicator `MPI_COMM_WORLD`

29.28.3.12 starpu_mpi_send()

```c
int starpu_mpi_send ( starpu_data_handle_t data_handle, int dest, starpu_mpi_tag_t data_tag, MPI_Comm comm )
```

Perform a standard-mode, blocking send of `data_handle` to the node `dest` using the message tag `data_tag` within the communicator `comm`.

29.28.3.13 starpu_mpi_send_prio()

```c
int starpu_mpi_send_prio ( starpu_data_handle_t data_handle, int dest, starpu_mpi_tag_t data_tag, int prio, MPI_Comm comm )
```

Similar to `starpu_mpi_send`, but takes a priority `prio`.

29.28.3.14 starpu_mpi_recv()

```c
int starpu_mpi_recv ( starpu_data_handle_t data_handle, int source, starpu_mpi_tag_t data_tag, MPI_Comm comm, MPI_Status * status )
```

Perform a standard-mode, blocking receive in `data_handle` from the node `source` using the message tag `data_tag` within the communicator `comm`.

29.28.3.15 starpu_mpi_isend()

```c
int starpu_mpi_isend ( starpu_data_handle_t data_handle, starpu_mpi_req * req, int dest, starpu_mpi_tag_t data_tag, MPI_Comm comm )
```

Post a standard-mode, non blocking send of `data_handle` to the node `dest` using the message tag `data_tag` within the communicator `comm`. After the call, the pointer to the request `req` can be used to test or to wait for the completion of the communication.

29.28.3.16 starpu_mpi_isend_prio()

```c
int starpu_mpi_isend_prio ( starpu_data_handle_t data_handle, starpu_mpi_req * req, int prio, MPI_Comm comm )
```
int dest,
starpu_mpi_tag_t data_tag,
int prio,
MPI_Comm comm )

Similar to starpu_mpi_isend, but takes a priority prio.

**29.28.3.17  starpu_mpi_irecv()**

int starpu_mpi_irecv ( )
    starpu_data_handle_t data_handle,
    starpu_mpi_req * req,
    int source,
    starpu_mpi_tag_t data_tag,
    MPI_Comm comm )

Post a nonblocking receive in data_handle from the node source using the message tag data_tag within the communicator comm. After the call, the pointer to the request req can be used to test or to wait for the completion of the communication.

**29.28.3.18  starpu_mpi_isend_detached()**

int starpu_mpi_isend_detached ( )
    starpu_data_handle_t data_handle,
    int dest,
    starpu_mpi_tag_t data_tag,
    MPI_Comm comm,
    void(*)(void *) callback,
    void * arg )

Post a standard-mode, non blocking send of data_handle to the node dest using the message tag data_tag within the communicator comm. On completion, the callback function is called with the argument arg. Similarly to the pthread detached functionality, when a detached communication completes, its resources are automatically released back to the system, there is no need to test or to wait for the completion of the request.

**29.28.3.19  starpu_mpi_isend_detached_prio()**

int starpu_mpi_isend_detached_prio ( )
    starpu_data_handle_t data_handle,
    int dest,
    starpu_mpi_tag_t data_tag,
    int prio,
    MPI_Comm comm,
    void(*)(void *) callback,
    void * arg )

Similar to starpu_mpi_isend_detached, but takes a priority prio.

**29.28.3.20  starpu_mpi_irecv_detached()**

int starpu_mpi_irecv_detached ( )
    starpu_data_handle_t data_handle,
    int source,
    starpu_mpi_tag_t data_tag,
    MPI_Comm comm,
    void(*)(void *) callback,
    void * arg )

Post a nonblocking receive in data_handle from the node source using the message tag data_tag within the communicator comm. On completion, the callback function is called with the argument arg. Similarly to the pthread detached functionality, when a detached communication completes, its resources are automatically released back to the system, there is no need to test or to wait for the completion of the request.
### 29.28.3.21  `starpu_mpi_irecv_detached_sequential_consistency()`

```c
int starpu_mpi_irecv_detached_sequential_consistency (    
    starpu_data_handle_t data_handle,    
    int source,    
    starpu_mpi_tag_t data_tag,    
    MPI_Comm comm,    
    void(*) (void *) callback,    
    void * arg,    
    int sequential_consistency )
```

Post a nonblocking receive in `data_handle` from the node `source` using the message tag `data_tag` within the communicator `comm`. On completion, the `callback` function is called with the argument `arg`. The parameter `sequential_consistency` allows to enable or disable the sequential consistency for `data_handle` (sequential consistency will be enabled or disabled based on the value of the parameter `sequential_consistency` and the value of the sequential consistency defined for `data_handle`). Similarly to the pthread detached functionality, when a detached communication completes, its resources are automatically released back to the system, there is no need to test or to wait for the completion of the request.

### 29.28.3.22  `starpu_mpi_issend()`

```c
int starpu_mpi_issend (    
    starpu_data_handle_t data_handle,    
    starpu_mpi_req * req,    
    int dest,    
    starpu_mpi_tag_t data_tag,    
    MPI_Comm comm )
```

Perform a synchronous-mode, non-blocking send of `data_handle` to the node `dest` using the message tag `data_tag` within the communicator `comm`.

### 29.28.3.23  `starpu_mpi_issend_prio()`

```c
int starpu_mpi_issend_prio (    
    starpu_data_handle_t data_handle,    
    starpu_mpi_req * req,    
    int dest,    
    starpu_mpi_tag_t data_tag,    
    int prio,    
    MPI_Comm comm )
```

Similar to `starpu_mpi_issend`, but takes a priority `prio`.

### 29.28.3.24  `starpu_mpi_issend_detached()`

```c
int starpu_mpi_issend_detached (    
    starpu_data_handle_t data_handle,    
    int dest,    
    starpu_mpi_tag_t data_tag,    
    MPI_Comm comm,    
    void(*) (void *) callback,    
    void * arg )
```

Perform a synchronous-mode, non-blocking send of `data_handle` to the node `dest` using the message tag `data_tag` within the communicator `comm`. On completion, the `callback` function is called with the argument `arg`. Similarly to the pthread detached functionality, when a detached communication completes, its resources are automatically released back to the system, there is no need to test or to wait for the completion of the request.

### 29.28.3.25  `starpu_mpi_wait()`

```c
int starpu_mpi_wait (    
    starpu_mpi_req * req,    
    MPI_Status * status )
```

Return when the operation identified by request `req` is complete.
### 29.28.3.26 starpu_mpi_test()

```c
int starpu_mpi_test (
    starpu_mpi_req * req,
    int * flag,
    MPI_Status * status )
```

If the operation identified by `req` is complete, set `flag` to 1. The `status` object is set to contain information on the completed operation.

### 29.28.3.27 starpu_mpi_barrier()

```c
int starpu_mpi_barrier ( MPI_Comm comm )
```

Block the caller until all group members of the communicator `comm` have called it.

### 29.28.3.28 starpu_mpi_wait_for_all()

```c
int starpu_mpi_wait_for_all ( MPI_Comm comm )
```

Wait until all StarPU tasks and communications for the given communicator are completed.

### 29.28.3.29 starpu_mpi_isend_detached_unlock_tag()

```c
int starpu_mpi_isend_detached_unlock_tag ( starpu_data_handle_t data_handle, int dest, starpu_mpi_tag_t data_tag, MPI_Comm comm, starpu_tag_t tag )
```

Post a standard-mode, non blocking send of `data_handle` to the node `dest` using the message tag `data_tag` within the communicator `comm`. On completion, `tag` is unlocked.

### 29.28.3.30 starpu_mpi_isend_detached_unlock_tag_prio()

```c
int starpu_mpi_isend_detached_unlock_tag_prio ( starpu_data_handle_t data_handle, int dest, starpu_mpi_tag_t data_tag, int prio, MPI_Comm comm, starpu_tag_t tag )
```

Similar to `starpu_mpi_isend_detached_unlock_tag()`, but takes a priority `prio`.

### 29.28.3.31 starpu_mpi_irecv_detached_unlock_tag()

```c
int starpu_mpi_irecv_detached_unlock_tag ( starpu_data_handle_t data_handle, int source, starpu_mpi_tag_t data_tag, MPI_Comm comm, starpu_tag_t tag )
```

Post a nonblocking receive in `data_handle` from the node `source` using the message tag `data_tag` within the communicator `comm`. On completion, `tag` is unlocked.

### 29.28.3.32 starpu_mpi_isend_array_detached_unlock_tag()

```c
int starpu_mpi_isend_array_detached_unlock_tag ( unsigned array_size, starpu_data_handle_t * data_handle, int * dest,
```
Module Documentation a.k.a StarPU’s API

```c
starpu_mpi_tag_t * data_tag,
MPI_Comm * comm,
starpu_tag_t tag
```

Post array size standard-mode, non blocking send. Each post sends the n-th data of the array data_handle to the n-th node of the array dest using the n-th message tag of the array data_tag within the n-th communicator of the array comm. On completion of all the requests, tag is unlocked.

### 29.28.3.33 starpu_mpi_isend_array_detached_unlock_tag_prio()

```c
int starpu_mpi_isend_array_detached_unlock_tag_prio (  
    unsigned array_size,
    starpu_data_handle_t * data_handle,
    int * dest,
    starpu_mpi_tag_t * data_tag,
    int * prio,
    MPI_Comm * comm,
    starpu_tag_t tag )
```

Similar to `starpu_mpi_isend_array_detached_unlock_tag()`, but takes a priority `prio`.

### 29.28.3.34 starpu_mpi_irecv_array_detached_unlock_tag()

```c
int starpu_mpi_irecv_array_detached_unlock_tag (  
    unsigned array_size,
    starpu_data_handle_t * data_handle,
    int * source,
    starpu_mpi_tag_t * data_tag,
    MPI_Comm * comm,
    starpu_tag_t tag )
```

Post array size nonblocking receive. Each post receives in the n-th data of the array data_handle from the n-th node of the array source using the n-th message tag of the array data_tag within the n-th communicator of the array comm. On completion of all the requests, tag is unlocked.

### 29.28.3.35 starpu_mpi_get_communication_tag()

```c
int starpu_mpi_get_communication_tag (  
    void )
```

todo

### 29.28.3.36 starpu_mpi_set_communication_tag()

```c
void starpu_mpi_set_communication_tag (  
    int tag )
```

todo

### 29.28.3.37 starpu_mpi_datatype_register()

```c
int starpu_mpi_datatype_register (  
    starpu_data_handle_t handle,
    starpu_mpi_datatype_allocate_func_t allocate_datatype_func,
    starpu_mpi_datatype_free_func_t free_datatype_func )
```

Register functions to create and free a MPI datatype for the given handle. It is important that the function is called before any communication can take place for a data with the given handle. See Exchanging User Defined Data Interface for an example.

### 29.28.3.38 starpu_mpi_datatype_unregister()

```c
int starpu_mpi_datatype_unregister (  
    starpu_data_handle_t handle )
```

Unregister the MPI datatype functions stored for the interface of the given handle.
29.28.3.39 starpu_mpi_comm_get_attr()

int starpu_mpi_comm_get_attr (  
    MPI_Comm comm,  
    int keyval,  
    void * attribute_val,  
    int * flag )

Retrieve an attribute value by key, similarly to the MPI function MPI_comm_get_attr(), except that the value is a pointer to int64_t instead of int. If an attribute is attached on comm to keyval, then the call returns flag equal to 1, and the attribute value in attribute_val. Otherwise, flag is set to 0.

29.28.3.40 starpu_mpi_cache_is_enabled()

int starpu_mpi_cache_is_enabled ( )

Return 1 if the communication cache is enabled, 0 otherwise

29.28.3.41 starpu_mpi_cache_set()

int starpu_mpi_cache_set (  
    int enabled )

If enabled is 1, enable the communication cache. Otherwise, clean the cache if it was enabled and disable it.

29.28.3.42 starpu_mpi_cache_flush()

void starpu_mpi_cache_flush (  
    MPI_Comm comm,  
    starpu_data_handle_t data_handle )

Clear the send and receive communication cache for the data data_handle and invalidate the value. The function has to be called at the same point of task graph submission by all the MPI nodes on which the handle was registered. The function does nothing if the cache mechanism is disabled (see STARPU_MPI_CACHE).

29.28.3.43 starpu_mpi_cache_flush_all_data()

void starpu_mpi_cache_flush_all_data (  
    MPI_Comm comm )

Clear the send and receive communication cache for all data and invalidate their values. The function has to be called at the same point of task graph submission by all the MPI nodes. The function does nothing if the cache mechanism is disabled (see STARPU_MPI_CACHE).

29.28.3.44 starpu_mpi_cached_receive()

int starpu_mpi_cached_receive (  
    starpu_data_handle_t data_handle )

Test whether data_handle is cached for reception, i.e. the value was previously received from the owner node, and not flushed since then.

29.28.3.45 starpu_mpi_cached_send()

int starpu_mpi_cached_send (  
    starpu_data_handle_t data_handle,  
    int dest )

Test whether data_handle is cached for emission to node dest, i.e. the value was previously sent to dest, and not flushed since then.

29.28.3.46 starpu_mpi_data_register_comm()

void starpu_mpi_data_register_comm (  
    starpu_data_handle_t data_handle,  
    starpu_mpi_tag_t data_tag,
Register to MPI a StarPU data handle with the given tag, rank and MPI communicator. It also automatically clears the MPI communication cache when unregistering the data.

29.28.3.47 starpu_mpi_data_set_tag()

void starpu_mpi_data_set_tag {
    starpu_data_handle_t handle,
    starpu_mpi_tag_t data_tag
}

Register to MPI a StarPU data handle with the given tag. No rank will be defined. It also automatically clears the MPI communication cache when unregistering the data.

29.28.3.48 starpu_mpi_data_set_rank_comm()

void starpu_mpi_data_set_rank_comm {
    starpu_data_handle_t handle,
    int rank,
    MPI_Comm comm
}

Register to MPI a StarPU data handle with the given rank and given communicator. No tag will be defined. It also automatically clears the MPI communication cache when unregistering the data.

29.28.3.49 starpu_mpi_data_get_rank()

int starpu_mpi_data_get_rank {
    starpu_data_handle_t handle
}

Return the rank of the given data.

29.28.3.50 starpu_mpi_data_get_tag()

starpu_mpi_tag_t starpu_mpi_data_get_tag {
    starpu_data_handle_t handle
}

Return the tag of the given data.

29.28.3.51 starpu_mpi_data_migrate()

void starpu_mpi_data_migrate {
    MPI_Comm comm,
    starpu_data_handle_t handle,
    int new_rank
}

Submits migration of the data onto the new_rank MPI node. This means both submitting the transfer of the data to node new_rank if it hasn't been submitted already, and setting the home node of the data to the new node. Further data transfers submitted by starpu_mpi_task_insert() will be done from that new node. This function thus needs to be called on all nodes which have registered the data at the same point of tasks submissions. This also flushes the cache for this data to avoid incoherencies.

29.28.3.52 starpu_mpi_insert_task()

int starpu_mpi_insert_task {
    MPI_Comm comm,
    struct starpu_codelet * codelet,
    ...
}

Call starpu_mpi_task_insert(). Symbol kept for backward compatibility.

29.28.3.53 starpu_mpi_task_insert()

int starpu_mpi_task_insert {
    MPI_Comm comm,
struct starpu_codelet * codelet,
...
)
Create and submit a task corresponding to codelet with the following arguments. The argument list must be zero-terminated.
The arguments following the codelet are the same types as for the function starpu_task_insert(). Access modes
for data can also be set with STARPU_SSEND to specify the data has to be sent using a synchronous and non-blocking mode (see starpu_mpi_issend()). The extra argument STARPU_EXECUTE_ON_NODE followed by an integer allows to specify the MPI node to execute the codelet. It is also possible to specify that the node owning a specific data will execute the codelet, by using STARPU_EXECUTE_ON_DATA followed by a data handle.
The internal algorithm is as follows:

1. Find out which MPI node is going to execute the codelet.
   - If there is only one node owning data in STARPU_W mode, it will be selected;
   - If there is several nodes owning data in STARPU_W mode, a node will be selected according to a given
     node selection policy (see STARPU_NODE_SELECTION_POLICY or starpu_mpi_node_selection←
     set_current_policy())
     - The argument STARPU_EXECUTE_ON_NODE followed by an integer can be used to specify the node;
     - The argument STARPU_EXECUTE_ON_DATA followed by a data handle can be used to specify that
       the node owning the given data will execute the codelet.

2. Send and receive data as requested. Nodes owning data which need to be read by the task are sending them
to the MPI node which will execute it. The latter receives them.

3. Execute the codelet. This is done by the MPI node selected in the 1st step of the algorithm.

4. If several MPI nodes own data to be written to, send written data back to their owners.

The algorithm also includes a communication cache mechanism that allows not to send data twice to the same MPI
node, unless the data has been modified. The cache can be disabled (see STARPU_MPI_CACHE).

29.28.3.54 starpu_mpi_task_build()

struct starpu_task * starpu_mpi_task_build (  
  MPI_Comm comm,
  struct starpu_codelet * codelet,
  ...  
)
Create a task corresponding to codelet with the following given arguments. The argument list must be zero-terminated.
The function performs the first two steps of the function starpu_mpi_task_insert(), i.e. submitting the
MPI communications needed before the execution of the task, and the creation of the task on one node. Only the
MPI node selected in the first step of the algorithm will return a valid task structure which can then be submitted,
others will return NULL. The function starpu_mpi_task_post_build() MUST be called after that on all nodes, and
after the submission of the task on the node which creates it, with the SAME list of arguments.

29.28.3.55 starpu_mpi_task_post_build()

int starpu_mpi_task_post_build (  
  MPI_Comm comm,
  struct starpu_codelet * codelet,
  ...  
)
MUST be called after a call to starpu_mpi_task_build(), with the SAME list of arguments. Perform the fourth – last – step of the algorithm described in starpu_mpi_task_insert().

29.28.3.56 starpu_mpi_get_data_on_node()

void starpu_mpi_get_data_on_node (  
  MPI_Comm comm,
  starpu_data_handle_t data_handle,
  int node  
)  
Transfer data data_handle to MPI node node, sending it from its owner if needed. At least the target node and
the owner have to call the function.
29.28.3.57  starpu_mpi_get_data_on_node_detached()

```c
void starpu_mpi_get_data_on_node_detached ( 
    MPI_Comm comm,
    starpu_data_handle_t data_handle,
    int node,
    void(*)(void *) callback,
    void * arg )
```

Transfer data `data_handle` to MPI node `node`, sending it from its owner if needed. At least the target node and the owner have to call the function. On reception, the `callback` function is called with the argument `arg`.

29.28.3.58  starpu_mpi_get_data_on_all_nodes_detached()

```c
void starpu_mpi_get_data_on_all_nodes_detached ( 
    MPI_Comm comm,
    starpu_data_handle_t data_handle )
```

Transfer data `data_handle` to all MPI nodes, sending it from its owner if needed. All nodes have to call the function.

29.28.3.59  starpu_mpi_node_selection_get_current_policy()

```c
int starpu_mpi_node_selection_get_current_policy ( )
```

Return the current policy used to select the node which will execute the codelet.

29.28.3.60  starpu_mpi_node_selection_set_current_policy()

```c
int starpu_mpi_node_selection_set_current_policy ( 
    int policy )
```

Set the current policy used to select the node which will execute the codelet. The policy `STARPU_MPI_NODE_SELECTION_MOST_R_DATA` selects the node having the most data in `STARPU_R` mode so as to minimize the amount of data to be transferred.

29.28.3.61  starpu_mpi_node_selection_register_policy()

```c
int starpu_mpi_node_selection_register_policy ( 
    starpu_mpi_select_node_policy_func_t policy_func )
```

Register a new policy which can then be used when there is several nodes owning data in `STARPU_W` mode. Here an example of function defining a node selection policy. The codelet will be executed on the node owing the first data with a size bigger than 1M, or on the node 0 if no data fits the given size.

```c
int my_node_selection_policy(int me, int nb_nodes, struct starpu_data_descr *descr, int nb_data) 
{
    // me is the current MPI rank
    // nb_nodes is the number of MPI nodes
    // descr is the description of the data specified when calling starpu_mpi_task_insert
    // nb_data is the number of data in descr
    int i;
    for(i= 0 ; i<nb_data ; i++)
    {
        starpu_data_handle_t data = descr[i].handle;
        enum starpu_data_access_mode mode = descr[i].mode;
        if (mode & STARPU_R)
        {
            int rank = starpu_data_get_rank(data);
            size_t size = starpu_data_get_size(data);
            if (size > 1024*1024) return rank;
        }
    }
    return 0;
}
```

29.28.3.62  starpu_mpi_node_selection_unregister_policy()

```c
int starpu_mpi_node_selection_unregister_policy ( 
    int policy )
```
Unregister a previously registered policy.

29.28.3.63 `starpu_mpi_redux_data()`

```c
void starpu_mpi_redux_data ( 
    MPI_Comm comm, 
    starpu_data_handle_t data_handle )
```

Perform a reduction on the given data handle. All nodes send the data to its owner node which will perform a reduction.

29.28.3.64 `starpu_mpi_redux_data_prio()`

```c
void starpu_mpi_redux_data_prio ( 
    MPI_Comm comm, 
    starpu_data_handle_t data_handle, 
    int prio )
```

Similar to `starpu_mpi_redux_data`, but takes a priority `prio`.

29.28.3.65 `starpu_mpi_scatter_detached()`

```c
int starpu_mpi_scatter_detached ( 
    starpu_data_handle_t * data_handles, 
    int count, 
    int root, 
    MPI_Comm comm, 
    void(*)(void *) callback, 
    void * sarg, 
    void (*)(void *) rcallback, 
    void * rarg )
```

Scatter data among processes of the communicator based on the ownership of the data. For each data of the array `data_handles`, the process `root` sends the data to the process owning this data. Processes receiving data must have valid data handles to receive them. On completion of the collective communication, the `callback` function is called with the argument `sarg` on the process `root`, the `rcallback` function is called with the argument `rarg` on any other process.

29.28.3.66 `starpu_mpi_gather_detached()`

```c
int starpu_mpi_gather_detached ( 
    starpu_data_handle_t * data_handles, 
    int count, 
    int root, 
    MPI_Comm comm, 
    void(*)(void *) callback, 
    void * sarg, 
    void (*)(void *) rcallback, 
    void * rarg )
```

Gather data from the different processes of the communicator onto the process `root`. Each process owning data handle in the array `data_handles` will send them to the process `root`. The process `root` must have valid data handles to receive the data. On completion of the collective communication, the `rcallback` function is called with the argument `rarg` on the process `root`, the `scallback` function is called with the argument `sarg` on any other process.

29.29 Task Bundles

**Typedefs**

- typedef struct _starpu_task_bundle * starpu_task_bundle_t
Functions

- void starpu_task_bundle_create (starpu_task_bundle_t *bundle)
- int starpu_task_bundle_insert (starpu_task_bundle_t bundle, struct starpu_task *task)
- int starpu_task_bundle_remove (starpu_task_bundle_t bundle, struct starpu_task *task)
- void starpu_task_bundle_close (starpu_task_bundle_t bundle)
- double starpu_task_bundle_expected_length (starpu_task_bundle_t bundle, struct starpu_perfmodel_arch *arch, unsigned nimpl)
- double starpu_task_bundle_expected_energy (starpu_task_bundle_t bundle, struct starpu_perfmodel_arch *arch, unsigned nimpl)
- double starpu_task_bundle_expected_data_transfer_time (starpu_task_bundle_t bundle, unsigned memory_node)

29.29.1 Detailed Description

29.29.2 Typedef Documentation

29.29.2.1 starpu_task_bundle_t

starpu_task_bundle_t

Opaque structure describing a list of tasks that should be scheduled on the same worker whenever it’s possible. It must be considered as a hint given to the scheduler as there is no guarantee that they will be executed on the same worker.

29.29.3 Function Documentation

29.29.3.1 starpu_task_bundle_create()

void starpu_task_bundle_create ( 
   starpu_task_bundle_t * bundle )

Factory function creating and initializing bundle, when the call returns, memory needed is allocated and bundle is ready to use.

29.29.3.2 starpu_task_bundle_insert()

int starpu_task_bundle_insert ( 
   starpu_task_bundle_t bundle, 
   struct starpu_task * task )

Insert task in bundle. Until task is removed from bundle its expected length and data transfer time will be considered along those of the other tasks of bundle. This function must not be called if bundle is already closed and/or task is already submitted. On success, it returns 0. There are two cases of error: if bundle is already closed it returns -EPERM, if task was already submitted it returns -EINVAL.

29.29.3.3 starpu_task_bundle_remove()

int starpu_task_bundle_remove ( 
   starpu_task_bundle_t bundle, 
   struct starpu_task * task )

Remove task from bundle. Of course task must have been previously inserted in bundle. This function must not be called if bundle is already closed and/or task is already submitted. Doing so would result in undefined behaviour. On success, it returns 0. If bundle is already closed it returns -ENOTDIR.
29.30 Task Lists

Data Structures

29.30.3 Function Documentation

29.30.3.1 starpu_task_list_init()

```c
void starpu_task_list_init (
    struct starpu_task_list * list )
```
Initialize a list structure

29.30.3.2 starpu_task_list_push_front()

```c
void starpu_task_list_push_front ( 
    struct starpu_task_list * list, 
    struct starpu_task * task )
```
Push task at the front of list

29.30.3.3 starpu_task_list_push_back()

```c
void starpu_task_list_push_back ( 
    struct starpu_task_list * list, 
    struct starpu_task * task )
```
Push task at the back of list

29.30.3.4 starpu_task_list_front()

```c
struct starpu_task * starpu_task_list_front ( 
    const struct starpu_task_list * list )
```
Get the front of list (without removing it)

29.30.3.5 starpu_task_list_back()

```c
struct starpu_task * starpu_task_list_back ( 
    const struct starpu_task_list * list )
```
Get the back of list (without removing it)

29.30.3.6 starpu_task_list_empty()

```c
int starpu_task_list_empty ( 
    const struct starpu_task_list * list )
```
Test if list is empty
29.30.3.7 starpu_task_list_erase()

```c
void starpu_task_list_erase (  
   struct starpu_task_list * list,  
   struct starpu_task * task )
```

Remove task from list

29.30.3.8 starpu_task_list_pop_front()

```c
struct starpu_task * starpu_task_list_pop_front (  
   struct starpu_task_list * list )
```

Remove the element at the front of list

29.30.3.9 starpu_task_list_pop_back()

```c
struct starpu_task * starpu_task_list_pop_back (  
   struct starpu_task_list * list )
```

Remove the element at the back of list

29.30.3.10 starpu_task_list_begin()

```c
struct starpu_task * starpu_task_list_begin (  
   const struct starpu_task_list * list )
```

Get the first task of list.

29.30.3.11 starpu_task_list_next()

```c
struct starpu_task * starpu_task_list_next (  
   const struct starpu_task * task )
```

Get the next task of list. This is not erase-safe.

29.30.3.12 starpu_task_list_ismember()

```c
int starpu_task_list_ismember (  
   const struct starpu_task_list * list,  
   const struct starpu_task * look )
```

Test whether the given task look is contained in the list.

29.31 Parallel Tasks

Functions

- int starpu_combined_worker_get_size (void)
- int starpu_combined_worker_get_rank (void)
- unsigned starpu_combined_worker_get_count (void)
- int starpu_combined_worker_get_id (void)
- int starpu_combined_worker_assign_workerid (int nworkers, int workerid_array[ ])
- int starpu_combined_worker_get_description (int workerid, int *worker_size, int **combined_workerid)
- int starpu_combined_worker_can_execute_task (unsigned workerid, struct starpu_task *task, unsigned nimpl)
- void starpu_parallel_task_barrier_init (struct starpu_task *task, int workerid)
- void starpu_parallel_task_barrier_init_n (struct starpu_task *task, int worker_size)

29.31.1 Detailed Description

29.31.2 Function Documentation
29.31.2.1 starpu_combined_worker_get_size()

```c
int starpu_combined_worker_get_size ( void )
```

Return the size of the current combined worker, i.e. the total number of cpus running the same task in the case of STARPU_SPMD parallel tasks, or the total number of threads that the task is allowed to start in the case of STARPU_FORKJOIN parallel tasks.

29.31.2.2 starpu_combined_worker_get_rank()

```c
int starpu_combined_worker_get_rank ( void )
```

Return the rank of the current thread within the combined worker. Can only be used in STARPU_FORKJOIN parallel tasks, to know which part of the task to work on.

29.31.2.3 starpu_combined_worker_get_count()

```c
unsigned starpu_combined_worker_get_count ( void )
```

Return the number of different combined workers.

29.31.2.4 starpu_combined_worker_get_id()

```c
int starpu_combined_worker_get_id ( void )
```

Return the identifier of the current combined worker.

29.31.2.5 starpu_combined_worker_assign_workerid()

```c
int starpu_combined_worker_assign_workerid ( int nworkers, int workerid_array[ ] )
```

Register a new combined worker and get its identifier.

29.31.2.6 starpu_combined_worker_get_description()

```c
int starpu_combined_worker_get_description ( int workerid, int * worker_size, int ** combined_workerid )
```

Get the description of a combined worker.

29.31.2.7 starpu_combined_worker_can_execute_task()

```c
int starpu_combined_worker_can_execute_task ( unsigned workerid, struct starpu_task * task, unsigned nimpl )
```

Variant of starpu_worker_can_execute_task() compatible with combined workers.

29.31.2.8 starpu_parallel_task_barrier_init()

```c
void starpu_parallel_task_barrier_init ( struct starpu_task * task, int workerid )
```

Initialise the barrier for the parallel task, and dispatch the task between the different workers of the given combined worker.
29.31.2.9 starpu_parallel_task_barrier_init_n()

```c
void starpu_parallel_task_barrier_init_n ( 
    struct starpu_task * task, 
    int worker_size )
```

Initialise the barrier for the parallel task, to be pushed to `worker_size` workers (without having to explicit a given combined worker).

29.32 Running Drivers

Data Structures

- struct starpu_driver
- union starpu_driver.id

Functions

- int starpu_driver_run (struct starpu_driver *d)
- int starpu_driver_init (struct starpu_driver *d)
- int starpu_driver_run_once (struct starpu_driver *d)
- int starpu_driver_deinit (struct starpu_driver *d)
- void starpu_drivers_request_termination (void)

29.32.1 Detailed Description

29.32.2 Data Structure Documentation

29.32.2.1 struct starpu_driver

structure for a driver

Data Fields

<table>
<thead>
<tr>
<th>enum starpu_worker_archtype</th>
<th>type</th>
<th>Type of the driver. Only STARPU_CPU_WORKER, STARPU_CUDA_WORKER and STARPU_OPENCL_WORKER are currently supported.</th>
</tr>
</thead>
<tbody>
<tr>
<td>union starpu_driver</td>
<td>id</td>
<td>Identifier of the driver.</td>
</tr>
</tbody>
</table>

29.32.2.2 union starpu_driver.id

Data Fields

- unsigned cpu_id
- unsigned cuda_id
- cl_device_id
- opencl_id

29.32.3 Function Documentation

29.32.3.1 starpu_driver_run()

```c
int starpu_driver_run ( 
    struct starpu_driver * d )
```

Initialize the given driver, run it until it receives a request to terminate, deinitialize it and return 0 on success. Return -EINVAL if `starpu_driver::type` is not a valid StarPU device type (STARPU_CPU_WORKER, STARPU_CUDA_→
WORKER or STARPU_OPENCL_WORKER).
This is the same as using the following functions: calling starpu_driver_init(), then calling starpu_driver_run_once() in a loop, and finally starpu_driver_deinit().

29.32.3.2 starpu_driver_init()

```c
int starpu_driver_init (struct starpu_driver * d )
```
Initialize the given driver. Return 0 on success, -EINVAL if starpu_driver::type is not a valid starpu_worker←archtype.

29.32.3.3 starpu_driver_run_once()

```c
int starpu_driver_run_once (struct starpu_driver * d )
```
Run the driver once, then return 0 on success, -EINVAL if starpu_driver::type is not a valid starpu_worker←archtype.

29.32.3.4 starpu_driver_deinit()

```c
int starpu_driver_deinit (struct starpu_driver * d )
```
Deinitialize the given driver. Return 0 on success, -EINVAL if starpu_driver::type is not a valid starpu_worker←archtype.

29.32.3.5 starpu_drivers_request_termination()

```c
void starpu_drivers_request_termination ( )
```
Notify all running drivers that they should terminate.

29.33 Expert Mode

Functions

- void starpu_wake_all_blocked_workers (void)
- int starpu_progression_hook_register (unsigned(+func)(void *arg), void *arg)
- void starpu_progression_hook_deregister (int hook_id)

29.33.1 Detailed Description

29.33.2 Function Documentation

29.33.2.1 starpu_wake_all_blocked_workers()

```c
void starpu_wake_all_blocked_workers ( void )
```
Wake all the workers, so they can inspect data requests and task submissions again.

29.33.2.2 starpu_progression_hook_register()

```c
int starpu_progression_hook_register ( unsigned(*)(void *arg) func,
void * arg )
```
Register a progression hook, to be called when workers are idle.
29.33.2.3 starpu_progression_hook_deregister()

```c
void starpu_progression_hook_deregister (int hook_id)
```

Unregister a given progression hook.

# 29.34 StarPU-Top Interface

## Data Structures

- `struct starpu_top_data`
- `struct starpu_top_param`

## Enumerations

- `enum starpu_top_data_type { STARPU_TOP_DATA_BOOLEAN, STARPU_TOP_DATA_INTEGER, STARPU_TOP_DATA_FLOAT }`
- `enum starpu_top_param_type { STARPU_TOP_PARAM_BOOLEAN, STARPU_TOP_PARAM_INTEGER, STARPU_TOP_PARAM_FLOAT, STARPU_TOP_PARAM_ENUM }`
- `enum starpu_top_message_type { TOP_TYPE_GO, TOP_TYPE_SET, TOP_TYPE_CONTINUE, TOP_TYPE_ENABLE, TOP_TYPE_DISABLE, TOP_TYPE_DEBUG, TOP_TYPE_UNKNOW }`

## Functions to call before the initialisation

- `struct starpu_top_data * starpu_top_add_data_boolean (const char *data_name, int active)`
- `struct starpu_top_data * starpu_top_add_data_integer (const char *data_name, int minimum_value, int maximum_value, int active)`
- `struct starpu_top_data * starpu_top_add_data_float (const char *data_name, double minimum_value, double maximum_value, int active)`
- `struct starpu_top_param * starpu_top_register_parameter_boolean (const char *param_name, int *parameter_field, void(*callback)(struct starpu_top_param *))`
- `struct starpu_top_param * starpu_top_register_parameter_float (const char *param_name, double *parameter_field, double minimum_value, double maximum_value, void(*callback)(struct starpu_top_param *))`
- `struct starpu_top_param * starpu_top_register_parameter_integer (const char *param_name, int *parameter_field, int minimum_value, int maximum_value, void(*callback)(struct starpu_top_param *))`
- `struct starpu_top_param * starpu_top_register_parameter_enum (const char *param_name, int *parameter_field, char **values, int nb_values, void(*callback)(struct starpu_top_param *))`

## Initialisation

- `void starpu_top_init_and_wait (const char *server_name)`

## To call after initialisation

- `void starpu_top_update_parameter (const struct starpu_top_param *param)`
- `void starpu_top_update_data_boolean (const struct starpu_top_data *data, int value)`
- `void starpu_top_update_data_integer (const struct starpu_top_data *data, int value)`
- `void starpu_top_update_data_float (const struct starpu_top_data *data, double value)`
- `void starpu_top_task_prevision (struct starpu_task *task, int devid, unsigned long long start, unsigned long long end)`
- `void starpu_top_debug_log (const char *message)`
- `void starpu_top_debug_lock (const char *message)`

</table>
```

29.34.4 Function Documentation

29.34.4.1 starpu_top_add_data_boolean()

```c
struct starpu_top_data * starpu_top_add_data_boolean (const char * data_name, int active)
```

Register a data named `data_name` of type boolean. If `active` is 0, the value will NOT be displayed to users. Any other value will make the value displayed.

29.34.4.2 starpu_top_add_data_integer()

```c
struct starpu_top_data * starpu_top_add_data_integer (const char * data_name, int minimum_value, int maximum_value, int active)
```

Register a data named `data_name` of type integer. `minimum_value` and `maximum_value` will be used to define the scale in the UI. If `active` is 0, the value will NOT be displayed to users. Any other value will make the value displayed.

29.34.4.3 starpu_top_add_data_float()

```c
struct starpu_top_data * starpu_top_add_data_float (const char * data_name, double minimum_value, double maximum_value, int active)
```

Register a data named `data_name` of type float. `minimum_value` and `maximum_value` will be used to define the scale in the UI. If `active` is 0, the value will NOT be displayed to users. Any other value will make the value displayed.
29.34 StarPU-Top Interface

29.34.4 starpu_top_register_parameter_boolean()

```c
struct starpu_top_param * starpu_top_register_parameter_boolean ( 
    const char * param_name,
    int * parameter_field,
    void(*)(struct starpu_top_param *) callback
)
```

Register a parameter named `param_name`, of type boolean. If not NULL, the callback function will be called when the parameter is modified by the UI.

29.34.5 starpu_top_register_parameter_float()

```c
struct starpu_top_param * starpu_top_register_parameter_float ( 
    const char * param_name,
    double * parameter_field,
    double minimum_value,
    double maximum_value,
    void(*)(struct starpu_top_param *) callback
)
```

Register a parameter named `param_name`, of type float. `minimum_value` and `maximum_value` will be used to prevent users from setting incorrect value. If not NULL, the callback function will be called when the parameter is modified by the UI.

29.34.6 starpu_top_register_parameter_integer()

```c
struct starpu_top_param * starpu_top_register_parameter_integer ( 
    const char * param_name,
    int * parameter_field,
    int minimum_value,
    int maximum_value,
    void(*)(struct starpu_top_param *) callback
)
```

Register a parameter named `param_name`, of type integer. `minimum_value` and `maximum_value` will be used to prevent users from setting incorrect value. If not NULL, the callback function will be called when the parameter is modified by the UI.

29.34.7 starpu_top_register_parameter_enum()

```c
struct starpu_top_param * starpu_top_register_parameter_enum ( 
    const char * param_name,
    int * parameter_field,
    char ** values,
    int nb_values,
    void(*)(struct starpu_top_param *) callback
)
```

Register a parameter named `param_name`, of type enum. `values` and `nb_values` will be used to prevent users from setting incorrect value. If not NULL, the callback function will be called when the parameter is modified by the UI.

29.34.8 starpu_top_init_and_wait()

```c
void starpu_top_init_and_wait ( 
    const char * server_name
)
```

Must be called when all parameters and data have been registered AND initialised (for parameters). It will wait for a TOP to connect, send initialisation sentences, and wait for the GO message.

29.34.9 starpu_top_update_parameter()

```c
void starpu_top_update_parameter ( 
    const struct starpu_top_param * param
)
```

Should be called after every modification of a parameter from something other than starpu_top. It notices the UI that the configuration has changed.
29.34.10  

starpu_top_update_data_boolean()

```c
void starpu_top_update_data_boolean (const struct starpu_top_data * data, int value)
```

Update the boolean value of `data` to `value` in the UI.

29.34.11  

starpu_top_update_data_integer()

```c
void starpu_top_update_data_integer (const struct starpu_top_data * data, int value)
```

Update the integer value of `data` to `value` in the UI.

29.34.12  

starpu_top_update_data_float()

```c
void starpu_top_update_data_float (const struct starpu_top_data * data, double value)
```

Update the float value of `data` to `value` in the UI.

29.34.13  

starpu_top_task_prevision()

```c
void starpu_top_task_prevision (struct starpu_task * task, int devid, unsigned long long start, unsigned long long end)
```

Notify the UI that `task` is planned to run from `start` to `end`, on computation-core.

29.34.14  

starpu_top_debug_log()

```c
void starpu_top_debug_log (const char * message)
```

When running in debug mode, display `message` in the UI.

29.34.15  

starpu_top_debug_lock()

```c
void starpu_top_debug_lock (const char * message)
```

When running in debug mode, send `message` to the UI and wait for a continue message to return. The lock (which creates a stop-point) should be called only by the main thread. Calling it from more than one thread is not supported.

29.35  

Scheduling Contexts

StarPU permits on one hand grouping workers in combined workers in order to execute a parallel task and on the other hand grouping tasks in bundles that will be executed by a single specified worker. In contrast when we group workers in scheduling contexts we submit starpu tasks to them and we schedule them with the policy assigned to the context. Scheduling contexts can be created, deleted and modified dynamically.

Data Structures

- `struct starpu_sched_ctx_performance_counters`

Scheduling Contexts Basic API

- `#define STARPU_SCHED_CTX_POLICY_NAME`
- `#define STARPU_SCHED_CTX_POLICY_STRUCT`
• #define STARPU_SCHED_CTX_POLICY_MIN_PRIO
• #define STARPU_SCHED_CTX_POLICY_MAX_PRIO
• #define STARPU_SCHED_CTX_AWAKE_WORKERS
• #define STARPU_SCHED_CTX_POLICY_INIT
• #define STARPU_SCHED_CTX_USER_DATA
• #define STARPU_SCHED_CTX_SUB_CTXS
• #define STARPU_SCHED_CTX_CUDA_NSMS
  • unsigned starpu_sched_ctx_create (int *workerids_ctx, int nworkers_ctx, const char *sched_ctx_name,...)
  • unsigned starpu_sched_ctx_create_inside_interval (const char *policy_name, const char *sched_ctx_name, int min_ncpus, int max_ncpus, int min_ngpus, int max_ngpus, unsigned allow_overlap)
  • void starpu_sched_ctx_register_close_callback (unsigned sched_ctx_id, void(close_callback)(unsigned sched_ctx_id, void *args), void *args)
  • void starpu_sched_ctx_add_workers (int *workerids_ctx, unsigned nworkers_ctx, unsigned sched_ctx_id)
  • void starpu_sched_ctx_remove_workers (int *workerids_ctx, unsigned nworkers_ctx, unsigned sched_ctx_id)

29.35.1 Detailed Description

StarPU permits on one hand grouping workers in combined workers in order to execute a parallel task and on the other hand grouping tasks in bundles that will be executed by a single specified worker. In contrast when we group workers in scheduling contexts we submit starpu tasks to them and we schedule them with the policy assigned to the context. Scheduling contexts can be created, deleted and modified dynamically.

29.35.2 Data Structure Documentation

29.35.2.1 `struct starpu_sched_ctx_performance_counters`

Performance counters used by the starpu to indicate the hypervisor how the application and the resources are executing.

Data Fields

- `void(* notify_idle_cycle)(unsigned sched_ctx_id, int worker, double idle_time)`
- `void(* notify_poped_task)(unsigned sched_ctx_id, int worker)`
- `void(* notify_pushed_task)(unsigned sched_ctx_id, int worker)`
- `void(* notify_post_exec_task)(struct starpu_task *task, size_t data_size, uint32_t footprint, int hypervisor_tag, double flops)`
- `void(* notify_submitted_job)(struct starpu_task *task, uint32_t footprint, size_t data_size)`
- `void(* notify_empty_ctx)(unsigned sched_ctx_id, struct starpu_task *task)`
- `void(* notify_delete_context)(unsigned sched_ctx_id)`

29.35.2.1.1 Field Documentation

29.35.2.1.1.1 notify_idle_cycle

`void(*)(starpu_sched_ctx_performance_counters::notify_idle_cycle)(unsigned sched_ctx_id, int worker, double idle_time)`

Inform the hypervisor for how long a worker has been idle in the specified context

29.35.2.1.1.2 notify_poped_task

`void(*)(starpu_sched_ctx_performance_counters::notify_poped_task)(unsigned sched_ctx_id, int worker)`

Inform the hypervisor that a task executing a specified number of instructions has been poped from the worker

29.35.2.1.1.3 notify_pushed_task

`void(*)(starpu_sched_ctx_performance_counters::notify_pushed_task)(unsigned sched_ctx_id, int worker)`

Notify the hypervisor that a task has been scheduled on the queue of the worker corresponding to the specified context

29.35.2.1.1.4 notify_post_exec_task

`void(*)(starpu_sched_ctx_performance_counters::notify_post_exec_task)(struct starpu_task *task, size_t data_size, uint32_t footprint, int hypervisor_tag, double flops)`

Notify the hypervisor that a task has just been executed
29.35 Scheduling Contexts

29.35.2.1.5  notify_submitted_job

void(* starpu_sched_ctx_performance_counters::notify_submitted_job)(struct starpu_task *task, uint32_t footprint, size_t data_size)

Notify the hypervisor that a task has just been submitted

29.35.2.1.6  notify_delete_context

void(* starpu_sched_ctx_performance_counters::notify_delete_context)(unsigned sched_ctx)

Notify the hypervisor that the context was deleted

29.35.3  Macro Definition Documentation

29.35.3.1  STARPU_SCHED_CTX_POLICY_NAME

#define STARPU_SCHED_CTX_POLICY_NAME
Used when calling starpu_sched_ctx_create() to specify a name for a scheduling policy

29.35.3.2  STARPU_SCHED_CTX_POLICY_STRUCT

#define STARPU_SCHED_CTX_POLICY_STRUCT
Used when calling starpu_sched_ctx_create() to specify a pointer to a scheduling policy

29.35.3.3  STARPU_SCHED_CTX_POLICY_MIN_PRIO

#define STARPU_SCHED_CTX_POLICY_MIN_PRIO
Used when calling starpu_sched_ctx_create() to specify a minimum scheduler priority value.

29.35.3.4  STARPU_SCHED_CTX_POLICY_MAX_PRIO

#define STARPU_SCHED_CTX_POLICY_MAX_PRIO
Used when calling starpu_sched_ctx_create() to specify a maximum scheduler priority value.

29.35.3.5  STARPU_SCHED_CTX_AWAKE_WORKERS

#define STARPU_SCHED_CTX_AWAKE_WORKERS
Used when calling starpu_sched_ctx_create() to specify a pointer to a scheduling policy

29.35.3.6  STARPU_SCHED_CTX_POLICY_INIT

#define STARPU_SCHED_CTX_POLICY_INIT
Used when calling starpu_sched_ctx_create() to specify a function pointer allowing to initialize the scheduling policy.

29.35.3.7  STARPU_SCHED_CTX_USER_DATA

#define STARPU_SCHED_CTX_USER_DATA
Used when calling starpu_sched_ctx_create() to specify a pointer to some user data related to the context being created.

29.35.3.8  STARPU_SCHED_CTX_SUB_CTXS

#define STARPU_SCHED_CTX_SUB_CTXS
Used when calling starpu_sched_ctx_create() to specify a list of sub contexts of the current context.

29.35.3.9  STARPU_SCHED_CTX_CUDA_NSMS

#define STARPU_SCHED_CTX_CUDA_NSMS
Used when calling starpu_sched_ctx_create() in order to create a context on the NVIDIA GPU to specify the number of SMs the context should have

Generated by Doxygen
29.35.3.10 STARPU_MIN_PRIO

#define STARPU_MIN_PRIO
Provided for legacy reasons.

29.35.3.11 STARPU_MAX_PRIO

#define STARPU_MAX_PRIO
Provided for legacy reasons.

29.35.3.12 STARPU_DEFAULT_PRIO

#define STARPU_DEFAULT_PRIO
By convention, the default priority level should be 0 so that we can statically allocate tasks with a default priority.

29.35.4 Function Documentation

29.35.4.1 starpu_sched_ctx_create()

unsigned starpu_sched_ctx_create (  
    int * workerids_ctx,  
    int nworkers_ctx,  
    const char * sched_ctx_name,  
    ... )

Create a scheduling context with the given parameters (see below) and assigns the workers in workerids_ctx to execute the tasks submitted to it. The return value represents the identifier of the context that has just been created. It will be further used to indicate the context the tasks will be submitted to. The return value should be at most STARPU_NMAX_SCHED_CTXS.

The arguments following the name of the scheduling context can be of the following types:

- **STARPU_SCHED_CTX_POLICY_NAME**, followed by the name of a predefined scheduling policy. Use an empty string to create the context with the default scheduling policy.
- **STARPU_SCHED_CTX_POLICY_STRUCT**, followed by a pointer to a custom scheduling policy (struct starpu_sched_policy *)
- **STARPU_SCHED_CTX_POLICY_MIN_PRIO**, followed by a integer representing the minimum priority value to be defined for the scheduling policy.
- **STARPU_SCHED_CTX_POLICY_MAX_PRIO**, followed by a integer representing the maximum priority value to be defined for the scheduling policy.
- **STARPU_SCHED_CTX_POLICY_INIT**, followed by a function pointer (ie. void init_sched(void)) allowing to initialize the scheduling policy.
- **STARPU_SCHED_CTX_USER_DATA**, followed by a pointer to a custom user data structure, to be retrieved by starpu_sched_ctx_get_user_data().

29.35.4.2 starpu_sched_ctx_create_inside_interval()

unsigned starpu_sched_ctx_create_inside_interval (  
    const char * policy_name,  
    const char * sched_ctx_name,  
    int min_ncpus,  
    int max_ncpus,  
    int min_ngpus,  
    int max_ngpus,  
    unsigned allow_overlap )

Create a context indicating an approximate interval of resources.
29.35.4.3 starpu_sched_ctx_register_close_callback()

```c
void starpu_sched_ctx_register_close_callback ( 
    unsigned sched_ctx_id, 
    void(void(void(sched_ctx_id, void *args)) close_callback, 
    void * args )
```

Execute the callback whenever the last task of the context finished executing, it is called with the parameters `sched_ctx` and any other parameter needed by the application (packed in `args`).

29.35.4.4 starpu_sched_ctx_add_workers()

```c
void starpu_sched_ctx_add_workers ( 
    int * workerids_ctx, 
    unsigned nworkers_ctx, 
    unsigned sched_ctx_id )
```

Add dynamically the workers in `workerids_ctx` to the context `sched_ctx_id`. The last argument cannot be greater than `STARPU_NMAX_SCHED_CTXS`.

29.35.4.5 starpu_sched_ctx_remove_workers()

```c
void starpu_sched_ctx_remove_workers ( 
    int * workerids_ctx, 
    unsigned nworkers_ctx, 
    unsigned sched_ctx_id )
```

Remove the workers in `workerids_ctx` from the context `sched_ctx_id`. The last argument cannot be greater than `STARPU_NMAX_SCHED_CTXS`.

29.35.4.6 starpu_sched_ctx_display_workers()

```c
void starpu_sched_ctx_display_workers ( 
    unsigned sched_ctx_id, 
    FILE * f )
```

Print on the file `f` the worker names belonging to the context `sched_ctx_id`.

29.35.4.7 starpu_sched_ctx_delete()

```c
void starpu_sched_ctx_delete ( 
    unsigned sched_ctx_id )
```

Delete scheduling context `sched_ctx_id` and transfer remaining workers to the inheritor scheduling context.

29.35.4.8 starpu_sched_ctx_set_inheritor()

```c
void starpu_sched_ctx_set_inheritor ( 
    unsigned sched_ctx_id, 
    unsigned inheritor )
```

Indicate which context will inherit the resources of this context when he will be deleted.

29.35.4.9 starpu_sched_ctx_set_context()

```c
void starpu_sched_ctx_set_context ( 
    unsigned * sched_ctx_id )
```

Set the scheduling context the subsequent tasks will be submitted to.

29.35.4.10 starpu_sched_ctx_get_context()

```c
unsigned starpu_sched_ctx_get_context ( 
    void )
```

Return the scheduling context the tasks are currently submitted to, or `STARPU_NMAX_SCHED_CTXS` if no default context has been defined by calling the function `starpu_sched_ctx_set_context()`.
29.35.4.11  starpu_sched_ctx_stop_task_submission()

void starpu_sched_ctx_stop_task_submission (  
    void  )

Stop submitting tasks from the empty context list until the next time the context has time to check the empty context list.

29.35.4.12  starpu_sched_ctx_finished_submit()

void starpu_sched_ctx_finished_submit (  
    unsigned  sched_ctx_id  )

Indicate starpu that the application finished submitting to this context in order to move the workers to the inheritor as soon as possible.

29.35.4.13  starpu_sched_ctx_get_workers_list()

unsigned starpu_sched_ctx_get_workers_list (  
    unsigned  sched_ctx_id,  
    int ** workerids  )

Return the list of workers in the array workerids, the returned value is the number of workers. The user should free the workerids table after finishing using it (it is allocated inside the function with the proper size).

29.35.4.14  starpu_sched_ctx_get_workers_list_raw()

unsigned starpu_sched_ctx_get_workers_list_raw (  
    unsigned  sched_ctx_id,  
    int ** workerids  )

Return the list of workers in the array workerids, the returned value is the number of workers. This list is provided in raw order, i.e. not sorted by tree or list order, and the user should not free the workerids table. This function is thus much less costly than starpu_sched_ctx_get_workers_list.

29.35.4.15  starpu_sched_ctx_get_nworkers()

unsigned starpu_sched_ctx_get_nworkers (  
    unsigned  sched_ctx_id  )

Return the number of workers managed by the specified contexts. (Usually needed to verify if it manages any workers or if it should be blocked).

29.35.4.16  starpu_sched_ctx_get_nshared_workers()

unsigned starpu_sched_ctx_get_nshared_workers (  
    unsigned  sched_ctx_id,  
    unsigned  sched_ctx_id2  )

Return the number of workers shared by two contexts.

29.35.4.17  starpu_sched_ctx_contains_worker()

unsigned starpu_sched_ctx_contains_worker (  
    int workerid,  
    unsigned  sched_ctx_id  )

Return 1 if the worker belongs to the context and 0 otherwise.

29.35.4.18  starpu_sched_ctx_worker_get_id()

unsigned starpu_sched_ctx_worker_get_id (  
    unsigned  sched_ctx_id  )

Return the workerid if the worker belongs to the context and -1 otherwise. If the thread calling this function is not a worker the function returns -1 as it calls the function starpu_worker_get_id().
29.35.4.19  
\textbf{starpu\_sched\_ctx\_overlapping\_ctxs\_on\_worker}\()\)

\begin{verbatim}
unsigned starpu_sched_ctx_overlapping_ctxs_on_worker ( int workerid )
\end{verbatim}

Check if a worker is shared between several contexts

29.35.4.20  
\textbf{starpu\_sched\_ctx\_set\_min\_priority}\()\)

\begin{verbatim}
int starpu_sched_ctx_set_min_priority ( unsigned sched_ctx_id, int min_prio )
\end{verbatim}

Define the minimum task priority level supported by the scheduling policy of the given scheduler context. The default minimum priority level is the same as the default priority level which is 0 by convention. The application may access that value by calling the function \textbf{starpu\_sched\_ctx\_get\_min\_priority}(). This function should only be called from the initialization method of the scheduling policy, and should not be used directly from the application.

29.35.4.21  
\textbf{starpu\_sched\_ctx\_set\_max\_priority}\()\)

\begin{verbatim}
int starpu_sched_ctx_set_max_priority ( unsigned sched_ctx_id, int max_prio )
\end{verbatim}

Define the maximum priority level supported by the scheduling policy of the given scheduler context. The default maximum priority level is 1. The application may access that value by calling the \textbf{starpu\_sched\_ctx\_get\_max\_priority} function. This function should only be called from the initialization method of the scheduling policy, and should not be used directly from the application.

29.35.4.22  
\textbf{starpu\_sched\_ctx\_get\_min\_priority}\()\)

\begin{verbatim}
int starpu_sched_ctx_get_min_priority ( unsigned sched_ctx_id )
\end{verbatim}

Return the current minimum priority level supported by the scheduling policy of the given scheduler context.

29.35.4.23  
\textbf{starpu\_sched\_ctx\_get\_max\_priority}\()\)

\begin{verbatim}
int starpu_sched_ctx_get_max_priority ( unsigned sched_ctx_id )
\end{verbatim}

Return the current maximum priority level supported by the scheduling policy of the given scheduler context.

29.35.4.24  
\textbf{starpu\_sched\_ctx\_min\_priority\_is\_set}\()\)

\begin{verbatim}
int starpu_sched_ctx_min_priority_is_set ( unsigned sched_ctx_id )
\end{verbatim}

todo

29.35.4.25  
\textbf{starpu\_sched\_ctx\_max\_priority\_is\_set}\()\)

\begin{verbatim}
int starpu_sched_ctx_max_priority_is_set ( unsigned sched_ctx_id )
\end{verbatim}

todo

29.35.4.26  
\textbf{starpu\_sched\_ctx\_get\_user\_data}\()\)

\begin{verbatim}
void * starpu_sched_ctx_get_user_data ( unsigned sched_ctx_id )
\end{verbatim}

Return the user data pointer associated to the scheduling context.
29.35.4.27 `starpu_sched_ctx_create_worker_collection()`

```c
struct starpu_worker_collection * starpu_sched_ctx_create_worker_collection ( 
    unsigned sched_ctx_id, 
    enum starpu_worker_collection_type type )
```

Create a worker collection of the type indicated by the last parameter for the context specified through the first parameter.

29.35.4.28 `starpu_sched_ctx_delete_worker_collection()`

```c
void starpu_sched_ctx_delete_worker_collection ( 
    unsigned sched_ctx_id )
```

Delete the worker collection of the specified scheduling context.

29.35.4.29 `starpu_sched_ctx_get_worker_collection()`

```c
struct starpu_worker_collection * starpu_sched_ctx_get_worker_collection ( 
    unsigned sched_ctx_id )
```

Return the worker collection managed by the indicated context.

29.35.4.30 `starpu_sched_ctx_set_perf_counters()`

```c
void starpu_sched_ctx_set_perf_counters ( 
    unsigned sched_ctx_id, 
    void * perf_counters )
```

Indicate to starpu the pointer to the performance counter.

29.35.4.31 `starpu_sched_ctx_call_pushed_task_cb()`

```c
void starpu_sched_ctx_call_pushed_task_cb ( 
    int workerid, 
    unsigned sched_ctx_id )
```

Callback that lets the scheduling policy tell the hypervisor that a task was pushed on a worker.

29.35.4.32 `starpu_sched_ctx_notify_hypervisor_exists()`

```c
void starpu_sched_ctx_notify_hypervisor_exists ( 
    void )
```

Allow the hypervisor to let starpu know he's initialised.

29.35.4.33 `starpu_sched_ctx_check_if_hypervisor_exists()`

```c
unsigned starpu_sched_ctx_check_if_hypervisor_exists ( 
    void )
```

Ask starpu if he is informed if the hypervisor is initialised.

29.35.4.34 `starpu_sched_ctx_set_policy_data()`

```c
void starpu_sched_ctx_set_policy_data ( 
    unsigned sched_ctx_id, 
    void * policy_data )
```

Allocate the scheduling policy data (private information of the scheduler like queues, variables, additional condition variables) the context.

29.35.4.35 `starpu_sched_ctx_get_policy_data()`

```c
void * starpu_sched_ctx_get_policy_data ( 
    unsigned sched_ctx_id )
```

Return the scheduling policy data (private information of the scheduler) of the contexts previously assigned to.
29.36 Scheduling Policy

29.35.4.36 starpu_sched_ctx_exec_parallel_code()

```c
void * starpu_sched_ctx_exec_parallel_code(
    void *(*)(void *) func,
    void * param,
    unsigned sched_ctx_id )
```

Execute any parallel code on the workers of the sched_ctx (workers are blocked)

29.35.4.37 starpu_sched_ctx_get_nready_tasks()

```c
int starpu_sched_ctx_get_nready_tasks(
    unsigned sched_ctx_id )
```
todo

29.35.4.38 starpu_sched_ctx_get_nready_flops()

```c
double starpu_sched_ctx_get_nready_flops(
    unsigned sched_ctx_id )
```
todo

29.36 Scheduling Policy

TODO. While StarPU comes with a variety of scheduling policies (see Task Scheduling Policies), it may sometimes be desirable to implement custom policies to address specific problems. The API described below allows users to write their own scheduling policy.

Scheduling Contexts Basic API

• #define STARPU_NMAX_SCHED_CTXS

29.36.1 Detailed Description

TODO. While StarPU comes with a variety of scheduling policies (see Task Scheduling Policies), it may sometimes be desirable to implement custom policies to address specific problems. The API described below allows users to write their own scheduling policy.

29.36.2 Data Structure Documentation

29.36.2.1 struct starpu_sched_policy

Contains all the methods that implement a scheduling policy. An application may specify which scheduling strategy in the field starpu_conf::sched_policy passed to the function starpu_init().

For each task going through the scheduler, the following methods get called in the given order:

• starpu_sched_policy::submit_hook when the task is submitted
• starpu_sched_policy::push_task when the task becomes ready. The scheduler is here given the task
• starpu_sched_policy::pop_task when the worker is idle. The scheduler here gives back the task to the core
• starpu_sched_policy::pre_exec_hook right before the worker actually starts the task computation (after transferring any missing data).
• starpu_sched_policy::post_exec_hook right after the worker actually completes the task computation.

For each task not going through the scheduler (because starpu_task::execute_on_a_specific_worker was set), these get called:

• starpu_sched_policy::submit_hook when the task is submitted
• starpu_sched_policy::push_task_notify when the task becomes ready. This is just a notification, the scheduler does not have to do anything about the task.
• starpu_sched_policy::pre_exec_hook right before the worker actually starts the task computation (after transferring any missing data).
• starpu_sched_policy::post_exec_hook right after the worker actually completes the task computation.
Data Fields

- `void(*)(init_sched)(unsigned sched_ctx_id)`
- `void(*)(deinit_sched)(unsigned sched_ctx_id)`
- `int(*)(push_task)(struct starpu_task*)`
- `double(*)(simulate_push_task)(struct starpu_task*)`
- `void(*)(push_task_notify)(struct starpu_task*, int workerid, int perf_workerid, unsigned sched_ctx_id)`
- `struct starpu_task(*)(pop_task)(unsigned sched_ctx_id)`
- `struct starpu_task(*)(pop_every_task)(unsigned sched_ctx_id)`
- `void(*)(submit_hook)(struct starpu_task*)`

- `void(*)(post_exec_hook)(struct starpu_task*, unsigned sched_ctx_id)`
- `void(*)(do_schedule)(unsigned sched_ctx_id)`
- `void(*)(add_workers)(unsigned sched_ctx_id, int* workerids, unsigned nworkers)`
- `void(*)(remove_workers)(unsigned sched_ctx_id, int* workerids, unsigned nworkers)`
- `const char* policy_name`
- `const char* policy_description`
- `enum starpu_worker_collection_type worker_type`

### Field Documentation

#### 29.36.2.1.1 init_sched

`void(*)(starpu_sched_policy::init_sched)(unsigned sched_ctx_id)`

Initialize the scheduling policy, called before any other method.

#### 29.36.2.1.2 deinit_sched

`void(*)(starpu_sched_policy::deinit_sched)(unsigned sched_ctx_id)`

Cleanup the scheduling policy, called before any other method.

#### 29.36.2.1.3 push_task

`int(*)(starpu_sched_policy::push_task)(struct starpu_task*)`

Insert a task into the scheduler, called when the task becomes ready for execution.

#### 29.36.2.1.4 push_task_notify

`void(*)(starpu_sched_policy::push_task_notify)(struct starpu_task*, int workerid, int perf_workerid, unsigned sched_ctx_id)`

Notify the scheduler that a task was pushed on a given worker. This method is called when a task that was explicitly assigned to a worker becomes ready and is about to be executed by the worker. This method therefore permits to keep the state of the scheduler coherent even when StarPU bypasses the scheduling strategy.

#### 29.36.2.1.5 pop_task

`struct starpu_task(*)(starpu_sched_policy::pop_task)(unsigned sched_ctx_id)`

Get a task from the scheduler. If this method returns NULL, the worker will start sleeping. If later on some task are pushed for this worker, starpu_wake_worker() must be called to wake the worker so it can call the pop_task() method again.

The mutex associated to the worker is already taken when this method is called. This method may release it (e.g. for scalability reasons when doing work stealing), but it must acquire it again before taking the decision whether to return a task or NULL, so the atomicity of deciding to return NULL and making the worker actually sleep is preserved. Otherwise in simgrid or blocking driver mode the worker might start sleeping while a task has just been pushed for it.

If this method is defined as NULL, the worker will only execute tasks from its local queue. In this case, the push_task method should use the starpu_push_local_task method to assign tasks to the different workers.

#### 29.36.2.1.6 pop_every_task

`struct starpu_task(*)(starpu_sched_policy::pop_every_task)(unsigned sched_ctx_id)`

Remove all available tasks from the scheduler (tasks are chained by the means of the field starpu_task::prev and starpu_task::next). The mutex associated to the worker is already taken when this method is called. This is currently not used and can be discarded.
29.36.2.1.7 submit_hook

```c
void(* starpu_sched_policy::submit_hook)(struct starpu_task *)
```

Optional field. This method is called when a task is submitted.

29.36.2.1.8 pre_exec_hook

```c
void(* starpu_sched_policy::pre_exec_hook)(struct starpu_task *)
```

Optional field. This method is called every time a task is starting.

29.36.2.1.9 post_exec_hook

```c
void(* starpu_sched_policy::post_exec_hook)(struct starpu_task *)
```

Optional field. This method is called every time a task has been executed.

29.36.2.1.10 do_schedule

```c
void(* starpu_sched_policy::do_schedule)(unsigned sched_ctx_id)
```

Optional field. This method is called when it is a good time to start scheduling tasks. This is notably called when the application calls `starpu_task_wait_for_all` or `starpu_do_schedule` explicitly.

29.36.2.1.11 add_workers

```c
void(* starpu_sched_policy::add_workers)(unsigned sched_ctx_id, int *workerids, unsigned nworkers)
```

Initialize scheduling structures corresponding to each worker used by the policy.

29.36.2.1.12 remove_workers

```c
void(* starpu_sched_policy::remove_workers)(unsigned sched_ctx_id, int *workerids, unsigned nworkers)
```

Deinitialize scheduling structures corresponding to each worker used by the policy.

29.36.2.1.13 policy_name

```c
const char * starpu_sched_policy::policy_name
```

Optional field. Name of the policy.

29.36.2.1.14 policy_description

```c
const char * starpu_sched_policy::policy_description
```

Optional field. Human readable description of the policy.

29.36.3 Macro Definition Documentation

29.36.3.1 STARPU_NMAX_SCHED_CTXS

```c
#define STARPU_NMAX_SCHED_CTXS
```

Define the maximum number of scheduling contexts managed by StarPU. The default value can be modified at configure by using the option `--enable-max-sched-ctxs`.

29.36.3.2 STARPU_MAXIMPLEMENTATIONS

```c
#define STARPU_MAXIMPLEMENTATIONS
```

Define the maximum number of implementations per architecture. The default value can be modified at configure by using the option `--enable-maximplementations`.

29.36.4 Function Documentation

29.36.4.1 starpu_sched_get_predefined_policies()

```c
struct starpu_sched_policy ** starpu_sched_get_predefined_policies()
```

Return an NULL-terminated array of all the predefined scheduling policies.
29.36.4.2 starpu_worker_get_sched_condition()

```c
void starpu_worker_get_sched_condition (
    int workerid,
    starpu_pthread_mutex_t ** sched_mutex,
    starpu_pthread_cond_t ** sched_cond )
```

When there is no available task for a worker, StarPU blocks this worker on a condition variable. This function specifies which condition variable (and the associated mutex) should be used to block (and to wake up) a worker. Note that multiple workers may use the same condition variable. For instance, in the case of a scheduling strategy with a single task queue, the same condition variable would be used to block and wake up all workers.

29.36.4.3 starpu_wake_worker_no_relax()

```c
int starpu_wake_worker_no_relax ( int workerid )
```

Must be called to wake up a worker that is sleeping on the cond. Return 0 whenever the worker is not in a sleeping state or has the state_keep_awake flag on.

29.36.4.4 starpu_wake_worker_locked()

```c
int starpu_wake_worker_locked ( int workerid )
```

Version of `starpu_wake_worker_no_relax()` which assumes that the sched mutex is locked.

29.36.4.5 starpu_sched_set_min_priority()

```c
int starpu_sched_set_min_priority ( int min_prio )
```

TODO: check if this is correct Define the minimum task priority level supported by the scheduling policy. The default minimum priority level is the same as the default priority level which is 0 by convention. The application may access that value by calling the function `starpu_sched_get_min_priority()`. This function should only be called from the initialization method of the scheduling policy, and should not be used directly from the application.

29.36.4.6 starpu_sched_set_max_priority()

```c
int starpu_sched_set_max_priority ( int max_prio )
```

TODO: check if this is correct Define the maximum priority level supported by the scheduling policy. The default maximum priority level is 1. The application may access that value by calling the function `starpu_sched_get_max_priority()`. This function should only be called from the initialization method of the scheduling policy, and should not be used directly from the application.

29.36.4.7 starpu_sched_get_min_priority()

```c
int starpu_sched_get_min_priority ( void )
```

TODO: check if this is correct Return the current minimum priority level supported by the scheduling policy.

29.36.4.8 starpu_sched_get_max_priority()

```c
int starpu_sched_get_max_priority ( void )
```

TODO: check if this is correct Return the current maximum priority level supported by the scheduling policy.

29.36.4.9 starpu_push_local_task()

```c
int starpu_push_local_task ( int workerid,
                               struct starpu_task * task,
                               int back )
```
The scheduling policy may put tasks directly into a worker’s local queue so that it is not always necessary to create its own queue when the local queue is sufficient. If `back` is not 0, `task` is put at the back of the queue where the worker will pop tasks first. Setting `back` to 0 therefore ensures a FIFO ordering.

29.36.4.10 `starpu_push_task_end()`

```c
int starpu_push_task_end (struct starpu_task *task)
```

Must be called by a scheduler to notify that the given task has just been pushed.

29.36.4.11 `starpu_worker_can_execute_task()`

```c
int starpu_worker_can_execute_task (unsigned workerid, struct starpu_task *task, unsigned nimpl)
```

Check if the worker specified by `workerid` can execute the codelet. Schedulers need to call it before assigning a task to a worker, otherwise the task may fail to execute.

29.36.4.12 `starpu_worker_can_execute_task_impl()`

```c
int starpu_worker_can_execute_task_impl (unsigned workerid, struct starpu_task *task, unsigned *impl_mask)
```

Check if the worker specified by `workerid` can execute the codelet and returns which implementation numbers can be used. Schedulers need to call it before assigning a task to a worker, otherwise the task may fail to execute. This should be preferred rather than calling `starpu_worker_can_execute_task` for each and every implementation. It can also be used with `impl_mask == NULL` to check for at least one implementation without determining which.

29.36.4.13 `starpu_worker_can_execute_task_first_impl()`

```c
int starpu_worker_can_execute_task_first_impl (unsigned workerid, struct starpu_task *task, unsigned *nimpl)
```

Check if the worker specified by `workerid` can execute the codelet and returns the first implementation which can be used. Schedulers need to call it before assigning a task to a worker, otherwise the task may fail to execute. This should be preferred rather than calling `starpu_worker_can_execute_task` for each and every implementation. It can also be used with `impl_mask == NULL` to check for at least one implementation without determining which.

29.36.4.14 `starpu_task_footprint()`

```c
uint32_t starpu_task_footprint (struct starpu_perfmodel *model, struct starpu_task *task, struct starpu_perfmodel_arch *arch, unsigned nimpl)
```

Return the footprint for a given task, taking into account user-provided perfmodel footprint or size_base functions.

29.36.4.15 `starpu_task_data_footprint()`

```c
uint32_t starpu_task_data_footprint (struct starpu_task *task)
```

Return the raw footprint for the data of a given task (without taking into account user-provided functions).

29.36.4.16 `starpu_task_expected_length()`

```c
double starpu_task_expected_length (struct starpu_task *task,
```
Return expected task duration in micro-seconds.

29.36.4.17 starpu_worker_get_relative_speedup()

double starpu_worker_get_relative_speedup (struct starpu_perfmodel_arch * perf_arch)

Return an estimated speedup factor relative to CPU speed.

29.36.4.18 starpu_task_expected_data_transfer_time()

double starpu_task_expected_data_transfer_time (unsigned memory_node, struct starpu_task * task)

Return expected data transfer time in micro-seconds for the given memory_node. Prefer using starpu_task_expected_data_transfer_time_for() which is more precise.

29.36.4.19 starpu_task_expected_data_transfer_time_for()

double starpu_task_expected_data_transfer_time_for (struct starpu_task * task, unsigned worker)

Return expected data transfer time in micro-seconds for the given worker.

29.36.4.20 starpu_data_expected_transfer_time()

double starpu_data_expected_transfer_time (starpu_data_handle_t handle, unsigned memory_node, enum starpu_data_access_mode mode)

Predict the transfer time (in micro-seconds) to move handle to a memory node.

29.36.4.21 starpu_task_expected_energy()

double starpu_task_expected_energy (struct starpu_task * task, struct starpu_perfmodel_arch * arch, unsigned nimpl)

Return expected energy consumption in J.

29.36.4.22 starpu_task_expected_conversion_time()

double starpu_task_expected_conversion_time (struct starpu_task * task, struct starpu_perfmodel_arch * arch, unsigned nimpl)

Return expected conversion time in ms (multiformat interface only).

29.36.4.23 starpu_get_prefetch_flag()

int starpu_get_prefetch_flag (void)

Whether STARPU_PREFETCH was set.

29.36.4.24 starpu_prefetch_task_input_on_node()

int starpu_prefetch_task_input_on_node (struct starpu_task * task, unsigned node)
Prefetch data for a given p task on a given p node

29.36.4.25 starpu_prefetch_task_input_on_node_prio()

int starpu_prefetch_task_input_on_node_prio (  
    struct starpu_task * task,  
    unsigned node,  
    int prio )

Prefetch data for a given p task on a given p node with a given priority

29.36.4.26 starpu_idle_prefetch_task_input_on_node()

int starpu_idle_prefetch_task_input_on_node (  
    struct starpu_task * task,  
    unsigned node )

Prefetch data for a given p task on a given p node when the bus is idle

29.36.4.27 starpu_idle_prefetch_task_input_on_node_prio()

int starpu_idle_prefetch_task_input_on_node_prio (  
    struct starpu_task * task,  
    unsigned node,  
    int prio )

Prefetch data for a given p task on a given p node when the bus is idle with a given priority

29.36.4.28 starpu_prefetch_task_input_for()

int starpu_prefetch_task_input_for (  
    struct starpu_task * task,  
    unsigned worker )

Prefetch data for a given p task on a given p worker

29.36.4.29 starpu_prefetch_task_input_for_prio()

int starpu_prefetch_task_input_for_prio (  
    struct starpu_task * task,  
    unsigned worker,  
    int prio )

Prefetch data for a given p task on a given p worker with a given priority

29.36.4.30 starpu_idle_prefetch_task_input_for()

int starpu_idle_prefetch_task_input_for (  
    struct starpu_task * task,  
    unsigned worker )

Prefetch data for a given p task on a given p worker when the bus is idle

29.36.4.31 starpu_idle_prefetch_task_input_for_prio()

int starpu_idle_prefetch_task_input_for_prio (  
    struct starpu_task * task,  
    unsigned worker,  
    int prio )

Prefetch data for a given p task on a given p worker when the bus is idle with a given priority

29.36.4.32 starpu_task_notify_ready_soon_register()

void starpu_task_notify_ready_soon_register (  
    starpu_notify_ready_soon_func f,  
    void * data )
Register a callback to be called when it is determined when a task will be ready an estimated amount of time from now, because its last dependency has just started and we know how long it will take.

```c
29.36.4.33 starpu_sched_ctx_worker_shares_tasks_lists()

void starpu_sched_ctx_worker_shares_tasks_lists ( int workerid,
                                                   int sched_ctx_id )
```

The scheduling policies indicates if the worker may pop tasks from the list of other workers or if there is a central list with task for all the workers

### 29.37 Tree

This section describes the tree facilities provided by StarPU.

#### Data Structures

- struct starpu_tree

#### Functions

- void starpu_tree_reset_visited (struct starpu_tree *tree, char *visited)
- void starpu_tree_insert (struct starpu_tree *tree, int id, int level, int is_pu, int arity, struct starpu_tree *father)
- struct starpu_tree * starpu_tree_get (struct starpu_tree *tree, int id)
- struct starpu_tree * starpu_tree_get_neighbour (struct starpu_tree *tree, struct starpu_tree *node, char *visited, char *present)
- void starpu_tree_free (struct starpu_tree *tree)

### 29.37.1 Detailed Description

This section describes the tree facilities provided by StarPU.

### 29.37.3 Function Documentation

#### 29.37.3.1 starpu_tree_reset_visited()

```c
void starpu_tree_reset_visited ( struct starpu_tree * tree,
                                  char * visited )
```
29.37.3.2 starpu_tree_insert()

```c
void starpu_tree_insert (   
    struct starpu_tree * tree,  
    int id,                     
    int level,                  
    int is_pu,                  
    int arity,                  
    struct starpu_tree * father )
```
todo

29.37.3.3 starpu_tree_get()

```c
struct starpu_tree * starpu_tree_get (   
    struct starpu_tree * tree, 
    int id )
```
todo

29.37.3.4 starpu_tree_get_neighbour()

```c
struct starpu_tree * starpu_tree_get_neighbour (   
    struct starpu_tree * tree,  
    struct starpu_tree * node,  
    char * visited,             
    char * present )
```
todo

29.37.3.5 starpu_tree_free()

```c
void starpu_tree_free (   
    struct starpu_tree * tree )
```
todo

29.38.1 Detailed Description

29.38.2 Macro Definition Documentation

29.38.2.1 SC_HYPERTVISOR_MAX_IDLE

#define SC_HYPERVISOR_MAX_IDLE
This macro is used when calling `sc_hypervisor_ctl()` and must be followed by 3 arguments: an array of int for the workerids to apply the condition, an int to indicate the size of the array, and a double value indicating the maximum idle time allowed for a worker before the resizing process should be triggered.

29.38.2.2 SC_HYPERVISOR_PRIORITY

#define SC_HYPERVISOR_PRIORITY
This macro is used when calling `sc_hypervisor_ctl()` and must be followed by 3 arguments: an array of int for the workerids to apply the condition, an int to indicate the size of the array, and an int value indicating the priority of the workers previously mentioned. The workers with the smallest priority are moved the first.

29.38.2.3 SC_HYPERVISOR_MIN_WORKERS

#define SC_HYPERVISOR_MIN_WORKERS
This macro is used when calling `sc_hypervisor_ctl()` and must be followed by 1 argument(int) indicating the minimum number of workers a context should have, underneath this limit the context cannot execute.

29.38.2.4 SC_HYPERVISOR_MAX_WORKERS

#define SC_HYPERVISOR_MAX_WORKERS
This macro is used when calling `sc_hypervisor_ctl()` and must be followed by 1 argument(int) indicating the maximum number of workers a context should have, above this limit the context would not be able to scale.

29.38.2.5 SC_HYPERVISOR_GRANULARITY

#define SC_HYPERVISOR_GRANULARITY
This macro is used when calling `sc_hypervisor_ctl()` and must be followed by 1 argument(int) indicating the granularity of the resizing process (the number of workers should be moved from the context once it is resized) This parameter is ignore for the Gflops rate based strategy (see Resizing Strategies), the number of workers that have to be moved is calculated by the strategy.
29.38.2.6 SC_HYPERVISOR_FIXED_WORKERS

#define SC_HYPERVISOR_FIXED_WORKERS
This macro is used when calling sc_hypervisor_ctl() and must be followed by 2 arguments: an array of int for the workerids to apply the condition and an int to indicate the size of the array. These workers are not allowed to be moved from the context.

29.38.2.7 SC_HYPERVISOR_MIN_TASKS

#define SC_HYPERVISOR_MIN_TASKS
This macro is used when calling sc_hypervisor_ctl() and must be followed by 1 argument (int) that indicated the minimum number of tasks that have to be executed before the context could be resized. This parameter is ignored for the Application Driven strategy (see Resizing Strategies) where the user indicates exactly when the resize should be done.

29.38.2.8 SC_HYPERVISOR_NEW_WORKERS_MAX_IDLE

#define SC_HYPERVISOR_NEW_WORKERS_MAX_IDLE
This macro is used when calling sc_hypervisor_ctl() and must be followed by 1 argument, a double value indicating the maximum idle time allowed for workers that have just been moved from other contexts in the current context.

29.38.2.9 SC_HYPERVISOR_TIME_TO_APPLY

#define SC_HYPERVISOR_TIME_TO_APPLY
This macro is used when calling sc_hypervisor_ctl() and must be followed by 1 argument (int) indicating the tag an executed task should have such that this configuration should be taken into account.

29.38.2.10 SC_HYPERVISOR_ISPEED_W_SAMPLE

#define SC_HYPERVISOR_ISPEED_W_SAMPLE
This macro is used when calling sc_hypervisor_ctl() and must be followed by 1 argument, a double, that indicates the number of flops needed to be executed before computing the speed of a worker.

29.38.2.11 SC_HYPERVISOR_ISPEED_CTX_SAMPLE

#define SC_HYPERVISOR_ISPEED_CTX_SAMPLE
This macro is used when calling sc_hypervisor_ctl() and must be followed by 1 argument, a double, that indicates the number of flops needed to be executed before computing the speed of a context.

29.38.2.12 SC_HYPERVISOR_NULL

#define SC_HYPERVISOR_NULL
This macro is used when calling sc_hypervisor_ctl() and must be followed by 1 arguments.

29.38.3 Function Documentation

29.38.3.1 sc_hypervisor_init()

void * sc_hypervisor_init {
    struct sc_hypervisor_policy * policy
}
There is a single hypervisor that is in charge of resizing contexts and the resizing strategy is chosen at the initialization of the hypervisor. A single resize can be done at a time. The Scheduling Context Hypervisor Plugin provides a series of performance counters to StarPU. By incrementing them, StarPU can help the hypervisor in the resizing decision making process. This function initializes the hypervisor to use the strategy provided as parameter and creates the performance counters (see starpu_sched_ctx_performance_counters). These performance counters represent actually some callbacks that will be used by the contexts to notify the information needed by the hypervisor.
29.38 Scheduling Context Hypervisor - Regular usage

Note: The Hypervisor is actually a worker that takes this role once certain conditions trigger the resizing process (there is no additional thread assigned to the hypervisor).

29.38.3.2 sc_hypervisor_shutdown()

```c
void sc_hypervisor_shutdown ( void )
```

The hypervisor and all information concerning it is cleaned. There is no synchronization between this function and `starpu_shutdown()`. Thus, this should be called after `starpu_shutdown()`, because the performance counters will still need allocated callback functions.

29.38.3.3 sc_hypervisor_register_ctx()

```c
void sc_hypervisor_register_ctx ( unsigned sched_ctx, double total_flops )
```

Scheduling Contexts that have to be resized by the hypervisor must be first registered to the hypervisor. This function registers the context to the hypervisor, and indicate the number of flops the context will execute (used for Gflops rate based strategy or any other custom strategy needing it, for the others we can pass 0.0)

29.38.3.4 sc_hypervisor_unregister_ctx()

```c
void sc_hypervisor_unregister_ctx ( unsigned sched_ctx )
```

Whenever we want to exclude contexts from the resizing process we have to unregister them from the hypervisor.

29.38.3.5 sc_hypervisor_resize_ctxs()

```c
void sc_hypervisor_resize_ctxs ( unsigned * sched_ctxs, int nsched_ctxs, int * workers, int nworkers )
```

Requires reconsidering the distribution of resources over the indicated scheduling contexts.

29.38.3.6 sc_hypervisor_stop_resize()

```c
void sc_hypervisor_stop_resize ( unsigned sched_ctx )
```

The user can totally forbid the resizing of a certain context or can then change his mind and allow it (in this case the resizing is managed by the hypervisor, that can forbid it or allow it).

29.38.3.7 sc_hypervisor_start_resize()

```c
void sc_hypervisor_start_resize ( unsigned sched_ctx )
```

Allow resizing of a context. The user can then provide information to the hypervisor concerning the conditions of resizing.

29.38.3.8 sc_hypervisor_get_policy()

```c
char * sc_hypervisor_get_policy ( )
```

Returns the name of the resizing policy the hypervisor uses.

29.38.3.9 sc_hypervisor_add_workers_to_sched_ctx()

```c
void sc_hypervisor_add_workers_to_sched_ctx ( int * workers_to_add, unsigned nworkers_to_add, unsigned sched_ctx )
```
Ask the hypervisor to add workers to a sched_ctx

29.38.3.10 sc_hypervisor_remove_workers_from_sched_ctx()

void sc_hypervisor_remove_workers_from_sched_ctx ( 
    int * workers_to_remove, 
    unsigned nworkers_to_remove, 
    unsigned sched_ctx, 
    unsigned now )

Ask the hypervisor to remove workers from a sched_ctx

29.38.3.11 sc_hypervisor_move_workers()

void sc_hypervisor_move_workers ( 
    unsigned sender_sched_ctx, 
    unsigned receiver_sched_ctx, 
    int * workers_to_move, 
    unsigned nworkers_to_move, 
    unsigned now )

Moves workers from one context to another

29.38.3.12 sc_hypervisor_size_ctxs()

void sc_hypervisor_size_ctxs ( 
    unsigned * sched_ctxs, 
    int nsched_ctxs, 
    int * workers, 
    int nworkers )

Ask the hypervisor to chose a distribution of workers in the required contexts

29.38.3.13 sc_hypervisor_set_type_of_task()

void sc_hypervisor_set_type_of_task ( 
    struct starpu_codelet * cl, 
    unsigned sched_ctx, 
    uint32_t footprint, 
    size_t data_size )

Indicate the types of tasks a context will execute in order to better decide the sizing of ctxs

29.38.3.14 sc_hypervisor_update_diff_total_flops()

void sc_hypervisor_update_diff_total_flops ( 
    unsigned sched_ctx, 
    double diff_total_flops )

Change dynamically the total number of flops of a context, move the deadline of the finishing time of the context

29.38.3.15 sc_hypervisor_update_diff_elapsed_flops()

void sc_hypervisor_update_diff_elapsed_flops ( 
    unsigned sched_ctx, 
    double diff_task_flops )

Change dynamically the number of the elapsed flops in a context, modify the past in order to better compute the speed

29.38.3.16 sc_hypervisor_ctl()

void sc_hypervisor_ctl ( 
    unsigned sched_ctx, 
    ... )
Inputs conditions to the context sched_ctx with the following arguments. The argument list must be zero-terminated.

### 29.39 Scheduling Context Hypervisor - Building a new resizing policy

#### Data Structures

- struct sc_hypervisor_policy
- struct sc_hypervisor_policy_config
- struct sc_hypervisor_wrapper
- struct sc_hypervisor_resize_ack
- struct sc_hypervisor_policy_task_pool

#### Macros

- #define STARPU_HYPERVISOR_TAG

#### Functions

- void sc_hypervisor_post_resize_request (unsigned sched_ctx, int task_tag)
- unsigned sc_hypervisor_get_size_req (unsigned **sched_ctxs, int *nsched_ctxs, int **workers, int *nworkers)
- void sc_hypervisor_save_size_req (unsigned *sched_ctxs, int nsched_ctxs, int *workers, int nworkers)
- void sc_hypervisor_free_size_req (void)
- unsigned sc_hypervisor_can_resize (unsigned sched_ctx)
- struct sc_hypervisor_policy_config * sc_hypervisor_get_config (unsigned sched_ctx)
- void sc_hypervisor_set_config (unsigned sched_ctx, void *config)
- unsigned * sc_hypervisor_get_sched_ctxs ()
- int sc_hypervisor_get_nsched_ctxs ()
- struct sc_hypervisor_wrapper * sc_hypervisor_get_wrapper (unsigned sched_ctx)
- double sc_hypervisor_get_elapsed_flops_per_sched_ctx (struct sc_hypervisor_wrapper *sc_w)

#### 29.39.1 Detailed Description

#### 29.39.2 Data Structure Documentation

##### 29.39.2.1 struct sc_hypervisor_policy

This structure contains all the methods that implement a hypervisor resizing policy.

#### Data Fields

- const char * name
- unsigned custom
- void(* size_ctxs )(unsigned *sched_ctxs, int nsched_ctxs, int *workers, int nworkers)
- void(* resize_ctxs )(unsigned *sched_ctxs, int nsched_ctxs, int *workers, int nworkers)
- void(* handle_idle_cycle )(unsigned sched_ctx, int worker)
- void(* handle_pushed_task )(unsigned sched_ctx, int worker)
- void(* handle_poped_task )(unsigned sched_ctx, int worker, struct starpu_task *task, uint32_t footprint)
- void(* handle_idle_end )(unsigned sched_ctx, int worker)
- void(* handle_post_exec_hook )(unsigned sched_ctx, int task_tag)
- void(* handle_submitted_job )(struct starpu_codelet *cl, unsigned sched_ctx, uint32_t footprint, size_t data_size)
- void(* end_ctx )(unsigned sched_ctx)
- void(* start_ctx )(unsigned sched_ctx)
- void(* init_worker )(int workerid, unsigned sched_ctx)
29.39.2.1 Field Documentation

29.39.2.1.1 name

\texttt{sc\_hypervisor\_policy::name}

Indicates the name of the policy, if there is not a custom policy, the policy corresponding to this name will be used by the hypervisor.

29.39.2.1.2 custom

\texttt{sc\_hypervisor\_policy::custom}

Indicates whether the policy is custom or not.

29.39.2.1.3 size\_ctxs

\texttt{sc\_hypervisor\_policy::size\_ctxs}

Distribute workers to contexts even at the beginning of the program.

29.39.2.1.4 resize\_ctxs

\texttt{sc\_hypervisor\_policy::resize\_ctxs}

Require explicit resizing.

29.39.2.1.5 handle\_idle\_cycle

\texttt{sc\_hypervisor\_policy::handle\_idle\_cycle}

It is called whenever the indicated worker executes another idle cycle in sched\_ctx.

29.39.2.1.6 handle\_pushed\_task

\texttt{sc\_hypervisor\_policy::handle\_pushed\_task}

It is called whenever a task is pushed on the worker's queue corresponding to the context sched\_ctx.

29.39.2.1.7 handle\_poped\_task

\texttt{sc\_hypervisor\_policy::handle\_poped\_task}

It is called whenever a task is popped from the worker's queue corresponding to the context sched\_ctx.

The hypervisor takes a decision when another task was popped from this worker in this ctx.

29.39.2.1.8 handle\_idle\_end

\texttt{sc\_hypervisor\_policy::handle\_idle\_end}

It is called whenever a task is executed on the indicated worker and context after a long period of idle time.

29.39.2.1.9 handle\_post\_exec\_hook

\texttt{sc\_hypervisor\_policy::handle\_post\_exec\_hook}

It is called whenever a tag task has just been executed. The table of resize requests is provided as well as the tag.

29.39.2.1.10 handle\_submitted\_job

\texttt{sc\_hypervisor\_policy::handle\_submitted\_job}

The hypervisor takes a decision when a job was submitted in this ctx.

29.39.2.1.11 end\_ctx

\texttt{sc\_hypervisor\_policy::end\_ctx}

The hypervisor takes a decision when a certain ctx was deleted.

29.39.2.2 struct \texttt{sc\_hypervisor\_policy\_config}

This structure contains all configuration information of a context. It contains configuration information for each context, which can be used to construct new resize strategies.

Data Fields

</tbody>
</table>

#### 29.39.3 Macro Definition Documentation

##### 29.39.3.1 STARPU_HYPERVISOR_TAG

```c
#define STARPU_HYPERVISOR_TAG
todo
```

#### 29.39.4 Function Documentation

##### 29.39.4.1 sc_hypervisor_post_resize_request()

```c
void sc_hypervisor_post_resize_request ( 
    unsigned sched_ctx, 
    int task_tag )
```

Requires resizing the context `sched_ctx` whenever a task tagged with the id `task_tag` finished executing.

##### 29.39.4.2 sc_hypervisor_get_size_req()

```c
unsigned sc_hypervisor_get_size_req ( 
    unsigned ** sched_ctxs, 
    int * nsched_ctxs, 
    int ** workers, 
    int * nworkers )
```

Check if there are pending demands of resizing.

##### 29.39.4.3 sc_hypervisor_save_size_req()

```c
void sc_hypervisor_save_size_req ( 
    unsigned * sched_ctxs, 
    int nsched_ctxs, 
    int * workers, 
    int nworkers )
```

Save a demand of resizing.

##### 29.39.4.4 sc_hypervisor_free_size_req()

```c
void sc_hypervisor_free_size_req ( 
    void )
```

Clear the list of pending demands of resizing.
29.39.4.5 sc_hypervisor_can_resize()

unsigned sc_hypervisor_can_resize {
    unsigned sched_ctx
}

Check out if a context can be resized

29.39.4.6 sc_hypervisor_get_config()

struct sc_hypervisor_policy_config * sc_hypervisor_get_config {
    unsigned sched_ctx
}

Returns the configuration structure of a context

29.39.4.7 sc_hypervisor_set_config()

void sc_hypervisor_set_config {
    unsigned sched_ctx,
    void * config
}

Set a certain configuration to a context

29.39.4.8 sc_hypervisor_get_sched_ctxs()

unsigned * sc_hypervisor_get_sched_ctxs {
}

Gets the contexts managed by the hypervisor

29.39.4.9 sc_hypervisor_get_nsched_ctxs()

int sc_hypervisor_get_nsched_ctxs {
}

Gets the number of contexts managed by the hypervisor

29.39.4.10 sc_hypervisor_get_wrapper()

struct sc_hypervisor_wrapper * sc_hypervisor_get_wrapper {
    unsigned sched_ctx
}

Returns the wrapper corresponding the context sched_ctx

29.39.4.11 sc_hypervisor_get_elapsed_flops_per_sched_ctx()

double sc_hypervisor_get_elapsed_flops_per_sched_ctx {
    struct sc_hypervisor_wrapper * sc_w
}

Returns the flops of a context elapsed from the last resize

29.40.1 Detailed Description

29.40.2 Data Structure Documentation

29.40.2.1 \texttt{struct} \texttt{starpu\_sched\_component}

This structure represent a scheduler module. A scheduler is a tree-like structure of them, some parts of scheduler can be shared by several contexts to perform some local optimisations, so, for all components, a list of parent is defined by \texttt{sched\_ctx\_id}. They embed there specialised method in a pseudo object-style, so calls are like \texttt{component\_>push\_task\{component,task\}}

Data Fields

29.40.2.1.1 Field Documentation

29.40.2.1.1.1 tree

struct starpu_sched_tree * starpu_sched_component::tree
The tree containing the component

29.40.2.1.1.2 workers

struct starpu_bitmap * starpu_sched_component::workers
this member contain the set of underlying workers

29.40.2.1.1.3 workers_in_ctx

starpu_sched_component::workers_in_ctx
this member contain the subset of starpu_sched_component::workers that is currently available in the context. The push method should take this member into account. this member is set with : component->workers UNION tree->workers UNION component->children[i]->workers_in_ctx iff exist x such as component->children[i]->parents[x] == component

29.40.2.1.1.4 data

void * starpu_sched_component::data
private data

29.40.2.1.1.5 nchildren

int starpu_sched_component::nchildren
the number of component's children

29.40.2.1.1.6 children

struct starpu_sched_component ** starpu_sched_component::children
the vector of component's children

29.40.2.1.1.7 nparents

int starpu_sched_component::nparents
the numbers of component's parents

29.40.2.1.1.8 parents

struct starpu_sched_component ** starpu_sched_component::parents
the vector of component's parents

29.40.2.1.1.9 add_child

void(* starpu_sched_component::add_child)(struct starpu_sched_component *component, struct starpu_sched_component *child)
add a child to component

29.40.2.1.1.10 remove_child

void(* starpu_sched_component::remove_child)(struct starpu_sched_component *component, struct starpu_sched_component *child)
remove a child from component

29.40.2.1.1.11 add_parent

void(* starpu_sched_component::add_parent)(struct starpu_sched_component *component, struct starpu_sched_component *parent)
todo
29.40.2.1.12  remove_parent

void(* starpu_sched_component::remove_parent)(struct starpu_sched_component *component, struct starpu_sched_component *parent)
todo

29.40.2.1.13  push_task

int(* starpu_sched_component::push_task)(struct starpu_sched_component *, struct starpu_task *)
push a task in the scheduler module. This function is called to push a task on component subtree, this can either
perform a recursive call on a child or store the task in the component, then it will be returned by a further pull_task
call. the caller must ensure that component is able to execute task. This method must either return 0 if it the task
was properly stored or passed over to a child component, or return a value different from 0 if the task could not be
consumed (e.g. the queue is full).

29.40.2.1.14  pull_task

struct starpu_task *(starpu_sched_component::pull_task)(struct starpu_sched_component *component, struct starpu_sched_component *to)
pop a task from the scheduler module. This function is called by workers to get a task from their parents. this function
should first return a locally stored task or perform a recursive call on the parents. the task returned by this function
should be executable by the caller

29.40.2.1.15  can_push

int(* starpu_sched_component::can_push)(struct starpu_sched_component *component, struct starpu_sched_component *to)
This function is called by a component which implements a queue, allowing it to signify to its parents that an empty
slot is available in its queue. This should return 1 if some tasks could be pushed The basic implementation of this
function is a recursive call to its parents, the user has to specify a personally-made function to catch those calls.

29.40.2.1.16  can_pull

int(* starpu_sched_component::can_pull)(struct starpu_sched_component *component)
This function allow a component to wake up a worker. It is currently called by component which implements a
queue, to signify to its children that a task have been pushed in its local queue, and is available to be popped by
a worker, for example. This should return 1 if some some container or worker could (or will) pull some tasks. The
basic implementation of this function is a recursive call to its children, until at least one worker have been woken up.

29.40.2.1.17  estimated_load

double(* starpu_sched_component::estimated_load)(struct starpu_sched_component *component)
is an heuristic to compute load of scheduler module. Basically the number of tasks divided by the sum of relatives
speedup of workers available in context. estimated_load(component) = sum(estimated_load(component_children))
+ nb_local_tasks / average(relative_speedup(underlying_worker))

29.40.2.1.18  estimated_end

starpu_sched_component::estimated_end
return the time when a worker will enter in starvation. This function is relevant only if the task->predicted member
has been set.

29.40.2.1.19  deinit_data

void(* starpu_sched_component::deinit_data)(struct starpu_sched_component *component)
called by starpu_sched_component_destroy. Should free data allocated during creation

29.40.2.1.20  notify_change_workers

void(* starpu_sched_component::notify_change_workers)(struct starpu_sched_component *component)
this function is called for each component when workers are added or removed from a context

29.40.2.1.21  properties

int starpu_sched_component::properties
todo

29.40.2.1.22  obj

hwloc_obj_t starpu_sched_component::obj

Generated by Doxygen
the hwloc object associated to scheduler module. points to the part of topology that is binded to this component, eg: a numa node for a ws component that would balance load between underlying sockets

29.40.2.2 struct starpu_sched_tree

The actual scheduler

Data Fields

<table>
<thead>
<tr>
<th>struct starpu_sched_component * root</th>
<th>this is the entry module of the scheduler</th>
</tr>
</thead>
<tbody>

29.40.2.7 struct starpu_sched_component_composed_recipe

parameters for starpu_sched_component_composed_component_create
29.40.2.8 struct starpu_sched_component_specs

Define how build a scheduler according to topology. Each level (except for hwloc_machine_composed_sched_component) can be NULL, then the level is just skipped. Bugs everywhere, do not rely on.

Data Fields

- struct starpu_sched_component_composed_recipe * hwloc_machine_composed_sched_component
- struct starpu_sched_component_composed_recipe * hwloc_component_composed_sched_component
- struct starpu_sched_component_composed_recipe * hwloc_socket_composed_sched_component
- struct starpu_sched_component_composed_recipe * hwloc_cache_composed_sched_component
- struct starpu_sched_component_composed_recipe *(worker_composed_sched_component)(enum starpu_worker_archtype archtype)
- int mix_heterogeneous_workers

29.40.3 Macro Definition Documentation

29.40.3.1 STARPU_SCHED_COMPONENT_IS_HOMOGENEOUS

#define STARPU_SCHED_COMPONENT_IS_HOMOGENEOUS(component)
indicate if component is homogeneous

29.40.3.2 STARPU_SCHED_COMPONENT_IS_SINGLE_MEMORY_NODE

#define STARPU_SCHED_COMPONENT_IS_SINGLE_MEMORY_NODE(component)
indicate if all workers have the same memory component

29.40.3.3 STARPU_SCHED_SIMPLE_DECIDE_WORKERS

#define STARPU_SCHED_SIMPLE_DECIDE_WORKERS
Request to create downstream queues per worker, i.e. the scheduling decision-making component will choose exactly which workers tasks should got to.

29.40.3.4 STARPU_SCHED_SIMPLE_DECIDE_MEMNODES

#define STARPU_SCHED_SIMPLE_DECIDE_MEMNODES
Request to create downstream queues per memory nodes, i.e. the scheduling decision-making component will choose which memory node tasks will go to.

29.40.3.5 STARPU_SCHED_SIMPLE_DECIDE_ARCHS

#define STARPU_SCHED_SIMPLE_DECIDE_ARCHS
Request to create downstream queues per computation arch, i.e. the scheduling decision-making component will choose whether tasks go to CPUs, or CUDA, or OpenCL, etc.

29.40.3.6 STARPU_SCHED_SIMPLE_PERFMODEL

#define STARPU_SCHED_SIMPLE_PERFMODEL
Request to add a perfmodel selector above the scheduling decision-making component. That way, only tasks with a calibrated performance model will be given to the component, other tasks will go to an eager branch that will distributed tasks so that their performance models will get calibrated. In other words, this is needed when using a component which needs performance models for tasks.

Generated by Doxygen
29.40.3.7  **STARPU_SCHED_SIMPLE_FIFO_ABOVE**

```c
#define STARPU_SCHED_SIMPLE_FIFO_ABOVE
```

Request to create a fifo above the scheduling decision-making component, otherwise tasks will be pushed directly to the component.
This is useful to store tasks if there is a fifo below which limits the number of tasks to be scheduled in advance. The scheduling decision-making component can also store tasks itself, in which case this flag is not useful.

29.40.3.8  **STARPU_SCHED_SIMPLE_FIFO_ABOVE_PRIO**

```c
#define STARPU_SCHED_SIMPLE_FIFO_ABOVE_PRIO
```

Request that the fifo above be sorted by priorities

29.40.3.9  **STARPU_SCHED_SIMPLE_FIFOS_BELOW**

```c
#define STARPU_SCHED_SIMPLE_FIFOS_BELOW
```

Request to create fifos below the scheduling decision-making component, otherwise tasks will be pulled directly from workers.
This is useful to be able to schedule a (tunable) small number of tasks in advance only.

29.40.3.10  **STARPU_SCHED_SIMPLE_FIFOS_BELOW_PRIO**

```c
#define STARPU_SCHED_SIMPLE_FIFOS_BELOW_PRIO
```

Request that the fifos below be sorted by priorities

29.40.3.11  **STARPU_SCHED_SIMPLE_WS_BELOW**

```c
#define STARPU_SCHED_SIMPLE_WS_BELOW
```

Request that work between workers using the same fifo below be distributed using a work stealing component.

29.40.3.12  **STARPU_SCHED_SIMPLE_IMPL**

```c
#define STARPU_SCHED_SIMPLE_IMPL
```

Request that a component be added just above workers, that chooses the best task implementation.

29.40.4  **Enumeration Type Documentation**

29.40.4.1  **starpu_sched_component_properties**

```c
enum starpu_sched_component_properties
flags for starpu_sched_component::properties
```

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STARPU_SCHED_COMPONENT_HOMOGENEOUS</td>
<td>indicate that all workers have the same starpu_worker_archtype</td>
</tr>
<tr>
<td>STARPU_SCHED_COMPONENT_SINGLE_MEMORY_NODE</td>
<td>indicate that all workers have the same memory component</td>
</tr>
</tbody>
</table>

29.40.5  **Function Documentation**
29.40.5.1 starpu_sched_tree_create()

```c
struct starpu_sched_tree * starpu_sched_tree_create (unsigned sched_ctx_id )
```
create a empty initialized starpu_sched_tree

29.40.5.2 starpu_sched_tree_destroy()

```c
void starpu_sched_tree_destroy (struct starpu_sched_tree * tree )
```
destroy tree and free all non shared component in it.

29.40.5.3 starpu_sched_tree_update_workers()

```c
void starpu_sched_tree_update_workers (struct starpu_sched_tree * t )
```
recursively set all starpu_sched_component::workers, do not take into account shared parts (except workers).

29.40.5.4 starpu_sched_tree_update_workers_in_ctx()

```c
void starpu_sched_tree_update_workers_in_ctx (struct starpu_sched_tree * t )
```
recursively set all starpu_sched_component::workers_in_ctx, do not take into account shared parts (except workers)

29.40.5.5 starpu_sched_tree_push_task()

```c
int starpu_sched_tree_push_task (struct starpu_task * task )
```
compatibility with starpu_sched_policy interface

29.40.5.6 starpu_sched_tree_pop_task()

```c
struct starpu_task * starpu_sched_tree_pop_task (unsigned sched_ctx )
```
compatibility with starpu_sched_policy interface

29.40.5.7 starpu_sched_tree_add_workers()

```c
void starpu_sched_tree_add_workers (unsigned sched_ctx_id, int * workerids, unsigned nworkers )
```
compatibility with starpu_sched_policy interface

29.40.5.8 starpu_sched_tree_remove_workers()

```c
void starpu_sched_tree_remove_workers (unsigned sched_ctx_id, int * workerids, unsigned nworkers )
```
compatibility with starpu_sched_policy interface

29.40.5.9 starpu_sched_component_connect()

```c
void starpu_sched_component_connect (struct starpu_sched_component * parent, struct starpu_sched_component * child )
```
Attaches component child to parent parent. Some component may accept only one child, others accept several (e.g. MCT)
29.40.5.10  starpu_sched_component_create()

struct starpu_sched_component * starpu_sched_component_create (  
    struct starpu_sched_tree * tree,  
    const char * name  
)  
allocate and initialize component field with defaults values : .pop_task make recursive call on father .estimated←_load compute relative speedup and tasks in sub tree .estimated_end return the average of recursive call on children .add_child is starpu_sched_component_add_child .remove_child is starpu_sched_component_remove_child .notify_change_workers does nothing .deinit_data does nothing

29.40.5.11  starpu_sched_component_destroy()

void starpu_sched_component_destroy (  
    struct starpu_sched_component * component  
)  
free data allocated by starpu_sched_component_create and call component->deinit_data(component) set to NULL the member starpu_sched_component::fathers[sched_ctx_id] of all child if its equal to component

29.40.5.12  starpu_sched_component_destroy_rec()

void starpu_sched_component_destroy_rec (  
    struct starpu_sched_component * component  
)  
recursively destroy non shared parts of a component 's tree

29.40.5.13  starpu_sched_component_can_execute_task()

int starpu_sched_component_can_execute_task (  
    struct starpu_sched_component * component,  
    struct starpu_task * task  
)  
return true iff component can execute task, this function take into account the workers available in the scheduling context

29.40.5.14  starpu_sched_component_execute_preds()

int starpu_sched_component_execute_preds (  
    struct starpu_sched_component * component,  
    struct starpu_task * task,  
    double * length  
)  
return a non NULL value if component can execute task. write the execution prediction length for the best implementation of the best worker available and write this at length address. this result is more relevant if starpu_sched_component::is_homogeneous is non NULL. if a worker need to be calibrated for an implementation, nan is set to length.

29.40.5.15  starpu_sched_component_transfer_length()

double starpu_sched_component_transfer_length (  
    struct starpu_sched_component * component,  
    struct starpu_task * task  
)  
return the average time to transfer task data to underlying component workers.

29.40.5.16  starpu_sched_component_worker_get()

struct starpu_sched_component * starpu_sched_component_worker_get (  
    unsigned sched_ctx,  
    int workerid  
)  
return the struct starpu_sched_component corresponding to workerid. Undefined if workerid is not a valid workerid
29.40.5.17  starpu_sched_component_worker_get_workerid()

int starpu_sched_component_worker_get_workerid (struct starpu_sched_component * worker_component)
return the workerid of worker_component, undefined if starpu_sched_component_is_worker(worker_component) == 0

29.40.5.18  starpu_sched_component_is_worker()

int starpu_sched_component_is_worker (struct starpu_sched_component * component)
return true iff component is a worker component

29.40.5.19  starpu_sched_component_is_simple_worker()

int starpu_sched_component_is_simple_worker (struct starpu_sched_component * component)
return true iff component is a simple worker component

29.40.5.20  starpu_sched_component_is_combined_worker()

int starpu_sched_component_is_combined_worker (struct starpu_sched_component * component)
return true iff component is a combined worker component

29.40.5.21  starpu_sched_component_worker_pre_exec_hook()

void starpu_sched_component_worker_pre_exec_hook (struct starpu_task * task, unsigned sched_ctx_id)
compatibility with starpu_sched_policy interface update predictions for workers

29.40.5.22  starpu_sched_component_worker_post_exec_hook()

void starpu_sched_component_worker_post_exec_hook (struct starpu_task * task, unsigned sched_ctx_id)
compatibility with starpu_sched_policy interface

29.40.5.23  starpu_sched_component_can_pull()

int starpu_sched_component_can_pull (struct starpu_sched_component * component)
default function for the can_pull component method, just calls can_pull of children until one of them returns non-zero

29.40.5.24  starpu_sched_component_estimated_load()

double starpu_sched_component_estimated_load (struct starpu_sched_component * component)
default function for the estimated_load component method, just sums up the loads of the children of the component.

29.40.5.25  starpu_sched_component_estimated_end_min()

double starpu_sched_component_estimated_end_min (struct starpu_sched_component * component)
function that can be used for the estimated_end component method, which just computes the minimum completion time of the children.
29.40.5.26 starpu_sched_component_estimated_end_average()

double starpu_sched_component_estimated_end_average (struct starpu_sched_component * component)

default function for the estimated_end component method, which just computes the average completion time of the children.

29.40.5.27 starpu_sched_component_fifo_create()

struct starpu_sched_component * starpu_sched_component_fifo_create (struct starpu_sched_tree * tree, struct starpu_sched_component_fifo_data * fifo_data)

Return a struct starpu_sched_component with a fifo. A stable sort is performed according to tasks priorities. A push_task call on this component does not perform recursive calls, underlying components will have to call pop_task to get it. starpu_sched_component: estimated_end function compute the estimated length by dividing the sequential length by the number of underlying workers. Do not take into account tasks that are currently executed.

29.40.5.28 starpu_sched_component_is_fifo()

int starpu_sched_component_is_fifo (struct starpu_sched_component * component)

return true iff component is a fifo component

29.40.5.29 starpu_sched_component_prio_create()

struct starpu_sched_component * starpu_sched_component_prio_create (struct starpu_sched_tree * tree, struct starpu_sched_component_prio_data * prio_data)

todo

29.40.5.30 starpu sched component is prio()

int starpu_sched_component_is_prio (struct starpu_sched_component * component)

todo

29.40.5.31 starpu_sched_component_work_stealing_create()

struct starpu_sched_component * starpu_sched_component_work_stealing_create (struct starpu_sched_tree * tree, void * arg)

return a component that perform a work stealing scheduling. Tasks are pushed in a round robin way. estimated_end returns the average of expected length of fifos, starting at the average of the expected_end of his children. When a worker have to steal a task, it steal a task in a round robin way, and get the last pushed task of the higher priority.

29.40.5.32 starpu_sched_tree_work_stealing_push_task()

int starpu_sched_tree_work_stealing_push_task (struct starpu_task * task)

undefined if there is no work stealing component in the scheduler. If any, task is pushed in a default way if the caller is the application, and in the caller's fifo if its a worker.

29.40.5.33 starpu_sched_component_is_work_stealing()

int starpu_sched_component_is_work_stealing (struct starpu_sched_component * component)

return true iff component is a work stealing component
29.40.5.34 starpu_sched_component_random_create()

struct starpu_sched_component * starpu_sched_component_random_create (  
    struct starpu_sched_tree * tree,  
    void * arg )

create a component that perform a random scheduling

29.40.5.35 starpu_sched_component_is_random()

int starpu_sched_component_is_random (  
    struct starpu_sched_component * )
return true iff component is a random component

29.40.5.36 starpu_sched_component_eager_create()

struct starpu_sched_component * starpu_sched_component_eager_create (  
    struct starpu_sched_tree * tree,  
    void * arg )
todo

29.40.5.37 starpu_sched_component_is_eager()

int starpu_sched_component_is_eager (  
    struct starpu_sched_component * )
todo

29.40.5.38 starpu_sched_component_eager_calibration_create()

struct starpu_sched_component * starpu_sched_component_eager_calibration_create (  
    struct starpu_sched_tree * tree,  
    void * arg )
todo

29.40.5.39 starpu_sched_component_is_eager_calibration()

int starpu_sched_component_is_eager_calibration (  
    struct starpu_sched_component * )
todo

29.40.5.40 starpu_sched_component_mct_create()

struct starpu_sched_component * starpu_sched_component_mct_create (  
    struct starpu_sched_tree * tree,  
    struct starpu_sched_component_mct_data * mct_data )
create a component with mct_data parameters. the mct component doesn't do anything but pushing tasks on node_perf_model_component and calibrating_component

29.40.5.41 starpu_sched_component_is_mct()

int starpu_sched_component_is_mct {  
    struct starpu_sched_component * component }
todo

29.40.5.42 starpu_sched_component_heft_create()

struct starpu_sched_component * starpu_sched_component_heft_create (  
    struct starpu_sched_tree * tree,  
    struct starpu_sched_component_mct_data * mct_data )
this component perform a heft scheduling
Module Documentation a.k.a StarPU's API

29.40.5.43 starpu_sched_component_is_heft()

```c
int starpu_sched_component_is_heft (struct starpu_sched_component * component )
return true iff component is a heft component
```

29.40.5.44 starpu_sched_component_best_implementation_create()

```c
struct starpu_sched_component * starpu_sched_component_best_implementation_create (struct starpu_sched_tree * tree, void * arg )
Select the implementation that offer the shortest computation length for the first worker that can execute the task. Or an implementation that need to be calibrated. Also set starpu_task::predicted and starpu_task::predicted_transfer for memory component of the first suitable workerid. If starpu_sched_component::push method is called and starpu_sched_component::nchild > 1 the result is undefined.
```

29.40.5.45 starpu_sched_component_perfmodel_select_create()

```c
struct starpu_sched_component * starpu_sched_component_perfmodel_select_create (struct starpu_sched_tree * tree, struct starpu_sched_component_perfmodel_select_data * perfmodel_select_data )
todo
```

29.40.5.46 starpu_sched_component_is_perfmodel_select()

```c
int starpu_sched_component_is_perfmodel_select (struct starpu_sched_component * component )
todo
```

29.40.5.47 starpu_sched_component_composed_recipe_create()

```c
struct starpu_sched_component_composed_recipe * starpu_sched_component_composed_recipe_create (void )
return an empty recipe for a composed component, it should not be used without modification
```

29.40.5.48 starpu_sched_component_composed_recipe_create_singleton()

```c
struct starpu_sched_component_composed_recipe * starpu_sched_component_composed_recipe_create_singleton (struct starpu_sched_component *(*)(struct starpu_sched_tree *tree, void *arg) create_component, void * arg )
return a recipe to build a composed component with a create_component
```

29.40.5.49 starpu_sched_component_composed_recipe_add()

```c
void starpu_sched_component_composed_recipe_add (struct starpu_sched_component_composed_recipe * recipe, struct starpu_sched_component *(*)(struct starpu_sched_tree *tree, void *arg) create_component, void * arg )
add create_component under all previous components in recipe
```

29.40.5.50 starpu_sched_component_composed_recipe_destroy()

```c
void starpu_sched_component_composed_recipe_destroy ( struct starpu_sched_component_composed_recipe * )
destroy composed_sched_component, this should be done after starpu_sched_component_composed_recipe_create was called
```
29.40.5.51 starpu_sched_component_composed_component_create()

```c
struct starpu_sched_component * starpu_sched_component_composed_component_create(
    struct starpu_sched_tree * tree,
    struct starpu_sched_component_composed_recipe * recipe
)
```

Create a component that behave as all component of recipe where linked. Except that you cannot use starpu_sched_component_is_foo function if recipe contain a single create_foo arg_foo pair, create_foo(arg_foo) is returned instead of a composed component.

29.40.5.52 starpu_sched_component_make_scheduler()

```c
struct starpu_sched_tree * starpu_sched_component_make_scheduler (unsigned sched_ctx_id,
    struct starpu_sched_component_specs s)
```

This function build a scheduler for sched_ctx_id according to s and the hwloc topology of the machine.

29.40.5.53 starpu_sched_component_initialize_simple_scheduler()

```c
void starpu_sched_component_initialize_simple_scheduler (starpu_sched_component_create_t create_decision_component,
    void * data,
    unsigned flags,
    unsigned sched_ctx_id )
```

This creates a simple modular scheduler tree around a scheduling decision-making component. The details of what should be built around component is described by flags. The different STARPU_SCHED_SIMPL_DECIDE_ flags are mutually exclusive. data is passed to the create_decision_component function when creating the decision component.

29.40.5.54 starpu_sched_component_push_task()

```c
int starpu_sched_component_push_task (struct starpu_sched_component * from,
    struct starpu_sched_component * to,
    struct starpu_task * task )
```

Push a task to a component. This is a helper for component->push_task(component, task) plus tracing.

29.40.5.55 starpu_sched_component_pull_task()

```c
struct starpu_task * starpu_sched_component_pull_task (struct starpu_sched_component * from,
    struct starpu_sched_component * to )
```

Pull a task from a component. This is a helper for component->pull_task(component) plus tracing.

Basic Data Management API

Data management is done at a high-level in StarPU: rather than accessing a mere list of contiguous buffers, the tasks may manipulate data that are described by a high-level construct which we call data interface.

An example of data interface is the "vector" interface which describes a contiguous data array on a specific memory node. This interface is a simple structure containing the number of elements in the array, the size of the elements, and the address of the array in the appropriate address space (this address may be invalid if there is...
no valid copy of the array in the memory node). More informations on the data interfaces provided by StarPU are given in Data Interfaces.

When a piece of data managed by StarPU is used by a task, the task implementation is given a pointer to an interface describing a valid copy of the data that is accessible from the current processing unit.

Every worker is associated to a memory node which is a logical abstraction of the address space from which the processing unit gets its data. For instance, the memory node associated to the different CPU workers represents main memory (RAM), the memory node associated to a GPU is DRAM embedded on the device. Every memory node is identified by a logical index which is accessible from the function starpu_worker_get_memory_node(). When registering a piece of data to StarPU, the specified memory node indicates where the piece of data initially resides (we also call this memory node the home node of a piece of data).

In the case of NUMA systems, functions starpu_memory_nodes_numa_devid_to_id() and starpu_memory_nodes_numa_id_to_devid() can be used to convert from NUMA node numbers as seen by the Operating System and NUMA node numbers as seen by StarPU.

- int starpu_data_interface_get_next_id (void)

Basic Data Management API

Data management is done at a high-level in StarPU: rather than accessing a mere list of contiguous buffers, the tasks may manipulate data that are described by a high-level construct which we call data interface.

An example of data interface is the “vector” interface which describes a contiguous data array on a specific memory node. This interface is a simple structure containing the number of elements in the array, the size of the
elements, and the address of the array in the appropriate address space (this address may be invalid if there is no valid copy of the array in the memory node). More informations on the data interfaces provided by StarPU are given in Data Interfaces.

When a piece of data managed by StarPU is used by a task, the task implementation is given a pointer to an interface describing a valid copy of the data that is accessible from the current processing unit.

Every worker is associated to a memory node which is a logical abstraction of the address space from which the processing unit gets its data. For instance, the memory node associated to the different CPU workers represents main memory (RAM), the memory node associated to a GPU is DRAM embedded on the device. Every memory node is identified by a logical index which is accessible from the function starpu_worker_get_memory_node(). When registering a piece of data to StarPU, the specified memory node indicates where the piece of data initially resides (we also call this memory node the home node of a piece of data).

In the case of NUMA systems, functions starpu_memory_nodes_numa_devid_to_id() and starpu_memory_nodes_numa_id_to_devid() can be used to convert from NUMA node numbers as seen by the Operating System and NUMA node numbers as seen by StarPU.

- void starpu_data_register (starpu_data_handle_t *handleptr, int home_node, void *data_interface, struct starpu_data_interface_ops *ops)
- void starpu_data_ptr_register (starpu_data_handle_t handle, unsigned node)
- void starpu_data_register_same (starpu_data_handle_t *handledst, starpu_data_handle_t handlesrc)
- starpu_data_handle_t starpu_data_lookup (const void *ptr)

Accessing Data Interfaces
Each data interface is provided with a set of field access functions. The ones using a void * parameter aimed to be used in codelet implementations (see for example the code in Vector Scaling Using StarPU’s API).

- void * starpu_data_handle_to_pointer (starpu_data_handle_t handle, unsigned node)
- int starpu_data_pointer_is_inside (starpu_data_handle_t handle, unsigned node, void *ptr)
- void * starpu_data_get_local_ptr (starpu_data_handle_t handle)
- enum starpu_data_interface_id starpu_data_get_interface_id (starpu_data_handle_t handle)
- int starpu_data_pack (starpu_data_handle_t handle, void **ptr, starpu_ssize_t *count)
- int starpu_data_unpack (starpu_data_handle_t handle, void *ptr, size_t count)
- size_t starpu_data_get_size (starpu_data_handle_t handle)

Registering Data
There are several ways to register a memory region so that it can be managed by StarPU. The functions below allow the registration of vectors, 2D matrices, 3D matrices as well as BCSR and CSR sparse matrices.

- void * starpu_data_get_interface_on_node (starpu_data_handle_t handle, unsigned memory_node)
- void * starpu_matrix_data_register (starpu_data_handle_t *handle, int home_node, uintptr_t ptr, uint32_t ld, uint32_t nx, uint32_t ny, size_t elemsize)
- void * starpu_matrix_ptr_register (starpu_data_handle_t handle, unsigned node, uintptr_t ptr, uintptr_t dev_handle, size_t offset, uint32_t ld)
- void * starpu_coo_data_register (starpu_data_handle_t *handleptr, int home_node, uint32_t nx, uint32_t ny, uint32_t n_values, uint32_t *columns, uint32_t *rows, uintptr_t values, size_telemsize)
- void * starpu_block_data_register (starpu_data_handle_t handle, int home_node, uintptr_t ptr, uint32_t ld, uint32_t nx, uint32_t ny, uint32_t nz, size_t elemsize)
- void * starpu_block_ptr_register (starpu_data_handle_t handle, unsigned node, uintptr_t ptr, uintptr_t dev_handle, size_t offset, uint32_t ld)
- void * starpu_vector_data_register (starpu_data_handle_t *handle, int home_node, uintptr_t ptr, uint32_t nx, size_t elemsize)
- void * starpu_vector_ptr_register (starpu_data_handle_t handle, unsigned node, uintptr_t ptr, uintptr_t dev_handle, size_t offset)
- void * starpu_variable_data_register (starpu_data_handle_t *handle, int home_node, uintptr_t ptr, size_t size)
- void * starpu_variable_ptr_register (starpu_data_handle_t handle, unsigned node, uintptr_t ptr, uintptr_t dev_handle, size_t offset)
- void * starpu_void_data_register (starpu_data_handle_t *handle)
- void * starpu_csr_data_register (starpu_data_handle_t *handle, int home_node, uint32_t nnz, uint32_t nrow, uintptr_t nzval, uint32_t *colind, uint32_t *rowptr, uint32_t firstentry, size_t elemsize)
- void * starpu_bcsr_data_register (starpu_data_handle_t *handle, int home_node, uint32_t nnz, uint32_t nrow, uintptr_t nzval, uint32_t *colind, uint32_t *rowptr, uint32_t firstentry, uint32_t r, uint32_t c, size_t elemsize)

Compiling OpenCL kernels

Source codes for OpenCL kernels can be stored in a file or in a string. StarPU provides functions to build the program executable for each available OpenCL device as a cl_program object. This program executable can then be loaded within a specific queue as explained in the next section. These are only helpers. Applications can also fill a `starpu_opencl_program` array by hand for more advanced use (e.g. different programs on the different OpenCL devices, for relocation purpose for instance).

Deprecated List

Global `starpu_codelet::cpu_func`
Optional field which has been made deprecated. One should use instead the field `starpu_codelet::cpu_funcs`.

Global `starpu_codelet::cuda_func`
Optional field which has been made deprecated. One should use instead the `starpu_codelet::cuda_funcs` field.

Global `starpu_codelet::opencl_func`
Optional field which has been made deprecated. One should use instead the `starpu_codelet::opencl_funcs` field.

Global `starpu_data_free_pinned_if_possible`
Equivalent to `starpu_free()`. This macro is provided to avoid breaking old codes.

Global `starpu_data_interface_ops::handle_to_pointer(starpu_data_handle_t handle, unsigned node)`
Use `starpu_data_interface_ops::to_pointer` instead. Return the current pointer (if any) for the handle on the given node.

Global `starpu_data_malloc_pinned_if_possible`
Equivalent to `starpu_malloc()`. This macro is provided to avoid breaking old codes.

Global `starpu_mpi_initialize(void)`
This function has been made deprecated. One should use instead the function `starpu_mpi_init()`. This function does not call `MPI_Init()`, it should be called beforehand.

Global `starpu_mpi_initialize_extended(int *rank, int *world_size)`
This function has been made deprecated. One should use instead the function `starpu_mpi_init()`. MPI will be initialized by `starpu_mpi` by calling `MPI_Init_Thread(argc, argv, MPI_THREAD_SERIALIZED, ...)`.

Global `STARPU_MULTIPLE_CPU_IMPLEMENTATIONS`
Setting the field `starpu_codelet::cpu_func` with this macro indicates the codelet will have several implementations. The use of this macro is deprecated. One should always only define the field `starpu_codelet::cpu_funcs`.

Global `STARPU_MULTIPLE_CUDA_IMPLEMENTATIONS`
Setting the field `starpu_codelet::cuda_func` with this macro indicates the codelet will have several implementations. The use of this macro is deprecated. One should always only define the field `starpu_codelet::cuda_funcs`.

Global `STARPU_MULTIPLE_OPENCL_IMPLEMENTATIONS`
Setting the field `starpu_codelet::opencl_func` with this macro indicates the codelet will have several implementations. The use of this macro is deprecated. One should always only define the field `starpu_codelet::opencl_funcs`.

    }
}
Chapter 34

GNU Free Documentation License

Version 1.3, 3 November 2008

Copyright

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

1. PREAMBLE

The purpose of this License is to make a manual, textbook, or other functional and useful document free in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of “copyleft”, which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

2. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The “Document”, below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as “you”. You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A “Modified Version” of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A “Secondary Section” is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The “Invariant Sections” are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.
The “Cover Texts” are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A “Transparent” copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text.

A copy that is not “Transparent” is called “Opaque”.

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The “Title Page” means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, “Title Page” means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

The “publisher” means any person or entity that distributes copies of the Document to the public.

A section “Entitled XYZ” means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as “Acknowledgements”, “Dedications”, “Endorsements”, or “History”.) To “Preserve the Title” of such a section when you modify the Document means that it remains a section “Entitled XYZ” according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

3. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you publish or distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

4. COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a
computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

5. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

(a) Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.

(b) List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.

(c) State on the Title page the name of the publisher of the Modified Version, as the publisher.

(d) Preserve all the copyright notices of the Document.

(e) Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

(f) Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

(g) Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

(h) Include an unaltered copy of this License.

(i) Preserve the section Entitled “History”, Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled “History” in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

(j) Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the “History” section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

(k) For any section Entitled “Acknowledgements” or “Dedications”, Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

(l) Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

(m) Delete any section Entitled “Endorsements”. Such a section may not be included in the Modified Version.

(n) Do not retile any existing section to be Entitled “Endorsements” or to conflict in title with any Invariant Section.

(o) Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.
You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

6. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements."

7. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

8. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an “aggregate” if the copyright resulting from the compilation is not used to limit the legal rights of the compilation’s users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document’s Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

9. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled “Acknowledgements”, “Dedications”, or “History”, the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.
10. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, or distribute it is void, and will automatically terminate your rights under this License.

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, receipt of a copy of some or all of the same material does not give you any rights to use it.

11. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License “or any later version” applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation. If the Document specifies that a proxy can decide which future versions of this License can be used, that proxy’s public statement of acceptance of a version permanently authorizes you to choose that version for the Document.

12. RELICENSING

“Massive Multiauthor Collaboration Site” (or “MMC Site”) means any World Wide Web server that publishes copyrightable works and also provides prominent facilities for anybody to edit those works. A public wiki that anybody can edit is an example of such a server. A “Massive Multiauthor Collaboration” (or “MMC”) contained in the site means any set of copyrightable works thus published on the MMC site.

“CC-BY-SA” means the Creative Commons Attribution-Share Alike 3.0 license published by Creative Commons Corporation, a not-for-profit corporation with a principal place of business in San Francisco, California, as well as future copyleft versions of that license published by that same organization.

“Incorporate” means to publish or republish a Document, in whole or in part, as part of another Document. An MMC is “eligible for relicensing” if it is licensed under this License, and if all works that were first published under this License somewhere other than this MMC, and subsequently incorporated in whole or in part into the MMC, (1) had no cover texts or invariant sections, and (2) were thus incorporated prior to November 1, 2008.

The operator of an MMC Site may republish an MMC contained in the site under CC-BY-SA on the same site at any time before August 1, 2009, provided the MMC is eligible for relicensing.

34.1 ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

Copyright (C) year your name. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.3 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled “GNU Free Documentation License”.

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the “with...Texts.” line with this:

Generated by Doxygen
with the Invariant Sections being list their titles, with the Front-Cover Texts being list, and with the
Back-Cover Texts being list.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alter-
natives to suit the situation.
If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel
under your choice of free software license, such as the GNU General Public License, to permit their use in free
software.
